<b>Course Code</b>	Deterministic & Stochastic Statistical Methods	L	Т	Р	С
20AOE9925		3	0	0	3
~ ~					

#### **Course Objectives**

Study of various Mathematical Methods and Statistical Methods which is needed for Artificial Intelligence, Machine Learning, and Data Science and also for Computer Science and engineering problems.

Course outcomes (CO): After completion of the course, the student can able to

**CO-1:** Apply logical thinking to problem-solving in context.

**CO-2:** Employ methods related to these concepts in a variety of data science applications.

**CO-3:** Use appropriate technology to aid problem-solving and data analysis.

**CO-4:** The Bayesian process of inference in probabilistic reasoning system.

**CO-5:** Demonstrate skills in unconstrained optimization.

#### Syllabus

#### UNIT - I- Data Representation

Distance measures, Projections, Notion of hyper planes, half-planes. Principal Component Analysis-Population Principal Components, sample principal coefficients, covariance, matrix of data set, Dimensionality reduction, Singular value decomposition, Gram Schmidt process.

#### **UNIT - II - Single Variable Distribution**

Random variables (discrete and continuous), probability density functions, properties, mathematical expectation Probability distribution - Binomial, Poisson approximation to the binomial distribution and normal distribution their properties-Uniform distribution-exponential distribution.

#### UNIT III- Stochastic Processes And Markov Chains:

Introduction to Stochastic processes- Markov process. Transition Probability, Transition Probability Matrix, First order and Higher order Markov process, step transition probabilities, Markov chain, Steady state condition, Markov analysis.

#### UNIT IV- Multivariate Distribution Theory

Multivariate Normal distribution Properties, Distributions of linear combinations, independence, marginal distributions, conditional distributions, Partial and Multiple correlation coefficient. Moment generating function. BAYESIAN INFERENCE AND ITS APPLICATIONS: Statistical tests and Bayesian model comparison, Bit, Surprisal, Entropy, Source coding theorem, Joint entropy, Conditional entropy, Kullback- Leibler divergence.

#### **UNIT V- Optimization**

Unconstrained optimization, Necessary and sufficiency conditions for optima, Gradient descent methods, Constrained optimization, KKT conditions, Introduction to non-gradient techniques, Introduction to least squares optimization, Optimization view of machine learning. Data Science Methods: Linear regression as an exemplar function approximation problem, linear classification problems.

#### **Textbooks:**

- 1. Mathematics for Machine Learning by A. Aldo Faisal, Cheng Soon Ong, and Marc Peter Deisenroth
- 2. Dr.B.S Grewal, Higher Engineering Mathematics, 45th Edition, Khanna Publishers.
- 3. Operations Research, S.D. Sharma

#### **Reference Books:**

- 1. Operations Research, An Introduction, Hamdy A. Taha, Pearson publishers.
- 2. A Probabilistic Theory of Pattern Recognition by Luc Devroye, Laszlo Gyorfi, Gabor Lugosi.

Page 2 of 131

 $\bigcirc$ )istonce Measures 2000E riched smaller Many algorithms whether supervised (05) use 2 distance Measures Unsupervised make These measures such as Euclidean distance (05) Cosine similarity Can often be found in algorithmy K-NN, UMAP, HOBSCAN etc. Such as Understanding the field of distance measure is more importance than you might realize. Distance measures plays an impostant in machine learning role They provide the foundation for many Popular and effective machine learning algorithms K- nearest neighborry for supervised learning like and K- means clustering for unsupervised learning. Knowing when to use which distance Can help you go from a foor classifies to an accusate model

There are mony distance measures which off explore how and when they best can be used.

distance measures Some of the main are follows below. (1) Euclidean distance (2) Manhatton distonce (3) Minkowski distance (A) Costine Index (m) Costine Similarity (5) Harming distonce (6) Chebyshev distance saidston of ships (7) Jaccard Index that we have a contract and here a theory of the contract and the any a set of and from the sources in the - in all it compares where a second to second it has their mater and at note gament  $\int_{\mathbb{T}^{n-1}} \int_{\mathbb{T}^{n-1}} \int_{\mathbb$ mostif a part of the second Arrive -- La Propert and the send years and have not and the first

Ð (1) Euclidean distance :-Euclideon distance is the distance between two points (er) the stearght line distance. To find the two points on a plane, the length of a segment Connecting the two points is measured. ve derive the Euclidean distance formula by using the pythagosas theosen. Euclidean distance formula. let us assume that (x1, y1) & (x2, y2) are the two points in a two-dimensional plane. Then the Euclidean distance formula is B(x2 y1) ini .  $d = \sqrt{(x_2 - x_1)^{n} + (y_2 - y_1)^{n}}$ A(XIY) in home of a where (x, y) are Co-ordinates of One point a X

(x2, y2) are Co-Ordinates of Other Porint d is the distance between (x1, y1) & (x2, y2)

The set of the set

and which has been a suit

(3)(3) what are the applications of Euclidean distance formula ? A) The Euclidean distance formula is used to find the length of a live segment given two points on a plane. Finding distance helps in proving the given Vertices form a square, Rectongle, etc (or) Peovry gives Vertices form on equilateral Ne Right ongled Ne etc. (4) What is the difference between Euclideon déstance formula & Montration déstance formula. Sol: For any two points (X, Y,) & (X2 Y2) on a plone -) The Euclidean déstance formerla says, the distance between the above points 18  $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ -) the Monhatton Alstonee formula says, the distance between the above points is?  $d = |X_2 - X_1| + |Y_2 - Y_1|$ 

(1) Find the distance between Points  $P(3_{12}) \otimes \Theta(4_{11})$ <u>Sol</u>: given  $P(3_{12}) \otimes \Omega(4_{11})$   $x_{19_{1}} \times x_{2} \otimes y_{2}$ Using Euclidean distance formula we have  $d = \overline{J(x_{2}-x_{1})^{n}+(y_{2}-y_{1})^{n}}$   $PQ = \overline{J(4-3)^{n}+(1-2)^{n}}$   $= \overline{J(1)^{n}+(-1)^{n}}$  $PQ = J_{2} \cup nits$ 

is Jz units

(2) Prove that points A (0,4) B(6,2) & C(9,1) are Collinear <u>Sol</u>: To Prove the given three points to be Collinear it is sufficient to prove that the sum of the distorces between two pairs of points is equal to the distorce. between the third pair.

now we will find the distance between every pairs of points Using the Euclidean distance formula.

$$AB = \sqrt{(b-0)^{n} + (2-4)^{n}}$$

$$= \sqrt{(b)^{n} + (2-5)^{n}}$$

$$= \sqrt{36+4} = \sqrt{40} = 2\sqrt{10}$$

$$BC = \sqrt{(9-6)^{n} + (1-2)^{n}}$$

$$= \sqrt{(3)^{n} + (2-1)^{n}} = \sqrt{9}$$

$$= \sqrt{(3)^{n} + (2-1)^{n}} = \sqrt{9}$$

$$= \sqrt{(3)^{n} + (2-1)^{n}}$$

$$= \sqrt{(3)^{n} + (2-3)^{n}}$$

$$= \sqrt{(3)^{n} + (2-3)^$$

(5)  

$$AB_{\pm} \overline{\int (\chi_{\pm} - \chi_{\pm})^{n} + (\chi_{\pm} - \chi_{\pm})^{n}}$$

$$= \overline{\int (0 - \sqrt{2})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 + 1)} = \sqrt{4} = \frac{2}{2} = .$$

$$BC_{\pm} \overline{\int (\chi_{\pm} - \chi_{\pm})^{n} + (\chi_{\pm} - \chi_{\pm})^{n}}$$

$$= \overline{\int (2 - 0)^{n} + (0 - 0)^{n}}$$

$$= \overline{\int 4 + 0} = \sqrt{4} = \frac{2}{2} = .$$

$$CA = \overline{\int (\chi_{\pm} - \chi_{\pm})^{n} + (\chi_{\pm} - \chi_{\pm})^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + (0 - 1)^{n}}$$

$$= \overline{\int (2 - \sqrt{3})^{n} + ((-1)^{n})}$$

(2) The Manhattan distance formerle says, the distance between the above pointe is d= [x2-x1] + [y2-y1]

5) Colluste the Exclidean distance between stoppen  
ADBAR advance the points (1,1,0) & (4,5,0)  
A In XY plane.  
Set: distance between points  
(1,1,0) (4,15,0)  
X(3) & X3 & 52  
d= 
$$\sqrt{(x_2 - x_1)^{\gamma}} + (y_2 - y_1)^{\gamma}$$
  
 $= \sqrt{(4-1)^{\gamma}} + (5-1)^{\gamma}$   
 $= \sqrt{(3)^{\gamma}} + (4)^{\gamma} = \sqrt{9} + 16 = \sqrt{26} = \frac{5}{2} \frac{(1)^{1/2}}{(23)^{\gamma}}$   
6) Calculate the distance between the two points  
 $A (-5, 2, 4) & B (-2, 2, 0)$   
 $X(3) & X_3 & Y_3 & Y_$ 

Las-Alter to - and the second of

7) The distance between (11213) & (41516) will be <u>Sol</u>:- (1,2,3) (4,5,6) X14131 X2 42 32  $D = \int (x_2 - x_1)^{\gamma} + (y_2 - y_1)^{\gamma} + (g_2 - g_1^{**})^{\gamma}$  $=\sqrt{(4-1)^{\gamma}+(5-2)^{\gamma}+(6-3)^{\gamma}}$  $=\sqrt{(3)^{n}+(3)^{n}+(3)^{n}}$  $= \sqrt{9+9+9} = \sqrt{27} Units$ (8) The distance between P(-1,2,3) & (4,0,-3) Ps <u>Sol</u>: (-1,2,3) (4,0,-3) x13181 x28282  $D = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (\xi_2 - \xi_1)^2}$  $=\sqrt{(4+1)^{n}+(0-2)^{n}+(-3-3)^{n}}$  $= \int (5)^{n} + (-2)^{n} + (-6)^{n}$ = V 25+4+36 = V65 units (9) The distance of the point (5,0,12) form the Origin (0,0,0) is <u>50</u>: (5,0,12) (0,0,0) x, y, z, x2 y2z2  $D = J (x_2 - x_1)^{n} + (y_2 - y_1)^{n} + (y_2 - y_1)^{n} = J(y_2 - y_1)^{n}$ 

$$\begin{cases} (5_{1} \circ (12)) & (0 \circ 0) \\ x_{1} y_{1} y_{1} & x_{2} y_{2} y_{3} \\ x_{2} y_{1} y_{1} & x_{2} y_{2} y_{3} \\ \end{cases}$$

$$D = \int (x_{1} - x_{1})^{n} + (y_{1} - y_{1})^{n} + (y_{2} - y_{3})^{n} + (y_{2} - y_{3})^{n} \\ = \int (0 - 5)^{n} + (0 - 5)^{n} + (0 - 12)^{n} \\ = \int (-5)^{n} + (0)^{n} + (-12)^{n} \\ = \int (-5)^{n} + (-12)^{n} + (-5)^{n} (-5)^{n} + (-5)^{n} + (-5)^{n} \\ = \int (-5)^{n} + (-5)^{n} + (-5)^{n} + (-5)^{n} \\ = \int (-5)^{n} + (-5)^{n} + (-5)^{n} + (-5)^{n}$$

and the standard and the second secon

(d) 
$$C_{03M2} - C_{03M2}(A + B) = A \cdot B + A +$$

(1) liven 5 Dimensional Simples  

$$A = (1_{10}, 2_{1}, 5_{1}, 3)$$

$$B = (2_{1}, 1_{0}, 3_{1}, -1) \text{ then Find.}$$
(1) Exclidean distance between fords -  $1(A_{K} - \theta_{K})^{m}$ 

$$= \sqrt{(1-2)^{m} + (0-1)^{m} + (2-0)^{m} + (5-3)^{m} + (3+1)^{m}}$$

$$= \frac{5 \cdot 09}{2}.$$
(3) Given black / Monbatten distance -  

$$\begin{bmatrix} 2^{m} \\ K_{E1} \\ K_{E1} \end{bmatrix} + \begin{bmatrix} 10 - 11 + 12 - 0 \end{bmatrix} + \begin{bmatrix} 3 - 3 \end{bmatrix} + \begin{bmatrix} 3 + 1 \end{bmatrix}$$

$$= \begin{bmatrix} -11 + 1 - 11 + 12 + 12 + 14 \\ = 1 + 1 + 2 + 2 + 4 \\ = 10 \\ \end{bmatrix}$$
(3) Minkowski distance -  
given exturnal Vanable  $P=3$ 

$$= \begin{bmatrix} 2 \\ |A_{K} - \theta_{K}|^{3} \end{bmatrix}^{\frac{1}{3}}$$

$$= \begin{bmatrix} (1-2]^{3} + |0-1|^{3} + |2-0|^{3} + |5-3|^{3} + (3+1)^{3} \end{bmatrix}^{\frac{1}{3}}$$

$$= \frac{4 \cdot 34}{4}.$$

$$\begin{bmatrix} 2 \\ |A_{K} - \theta_{K}|^{p} \end{bmatrix}^{\frac{1}{p}}$$

(2) Manhatton déstance :-This determines the obsolute différence among the Pair of the Coordinates.

Suppose we have two points pand 62 to determine the distance between these Points we simply have to calculate the Porperdiculary distance of the points from X-axis & Y-axis In a plane with p at Goodinate (X, Y1) and Q at (x2 y2)

Monhatter distance between P& 62 FS.

 $d = |x_2 - x_1| + |y_2 - y_1|$ 

The Manhatten distance, often Geled as "Taxifcab distance" (or) City Black distance. Galadates the distance between real-valued vectors Imogine vectors that describe Objects on a Uniborn grid such as a <u>Cheesboard</u>. Manhatten distance then suckers to the distance between two vectors Elf they Could only more stight angles. There is no disgonal movement involved. in Calculatey the distance.

The Monhatton distance between two points  

$$(x_1, y_1) \otimes (x_2, y_2)$$
 is given as  
 $|x_1 - x_2| + |y_1 - y_2|$  (or)  $|x_2 - x_1| + |y_2 - y_1|$   
(1) Find the Monhatton distance between the points  
given below  
(1)  $(1,2) (3,4)$   
 $x_1, y_1 - x_2, y_2$   
 $\Rightarrow |3-1| + |4-2|$   
 $\Rightarrow 2 + 2 = 4$   
(2)  $(-4,6) (3i-4)$  /  
 $x_1, y_1 - x_2, y_2$   
 $\Rightarrow |3+4| + |-4-6|$   
 $\Rightarrow |3+4| + |-4-6|$   
 $\Rightarrow |7+|+|-10|$   
 $\Rightarrow 7+10 = 17$ .  
 $\Rightarrow$  Monhatton distance is the most perforable  
for high dimensional applications  
Thus Monhatton distance is performed over the  
Exclident distance metric as the distance between  $y_1$   
 $the date increases.$   
 $\Rightarrow$  If we need to calculate the distance between  $y_1$ 

(3) Calculate the Monhatton distance form the Points given below  $X_1 = (1, 2, 3, 4, 5, 6)$  $\chi_2 = (10, 20, 30, 1, 2, 13)$  $\implies |10-1| + |20-2| + |30-3| + |1-4| + |2-5| + |3-6|$ => 9+18+27+3+3+3  $\rightarrow 63$ Crede in the (3) Min Kowski distance :-Minkouski distance is a distance measured between two points in N- dimensional space. It is basically a generalization of the Euclidean distance and Manhatton distance: It is widely used in field of machine Learning especially in the Concept to find the optimely Correlation or Classification of data Minkowski distance is used in Certain algorithme like K- Nearest Neighbors, LVQ. ( Learning Vector Quantization ), SOM (self Organizy Map) and K- Means clustering

-) let US Graides & dimensional space having  
there points  

$$P_1(x_1y_1)$$
,  $P_2(x_2y_2)$   $P_3(x_3y_3)$   
The Minkowski distance is given by  
 $\left(1x_1-y_1|^{p}+1x_2-y_2|^{p}+1x_3-y_3|^{p}\right)^{1/p}$   
 $\left(1x_1-y_1|^{p}+1x_2-y_2|^{p}+1x_3-y_3|^{p}\right)^{1/p}$   
The formula for Minkowski distance is given  
as  
 $D(x_1y_1) = \left(\sum_{i=1}^{n} |x_i-y_i|^{p}\right)^{\frac{1}{p}}$   
Most intersettingly about this distance measure  
is use  $P_1$  parametes  $P_1$   
use Can use this formerets  $P_1$   
 $use Can use the formula formula  $P_1$

(3) Caluxase the Minkowski distance between  
two vectors using a power 
$$g [P=3]$$
  
 $A = (2,4,4,6)$   
 $B = (5,5,7,8)$   
(4)  $A = (2,4,4,16)$  pole : Each vector in  
 $B = (5,5,7,8)$  the motory should be  
 $C = (q,q,q,8)$  the same length.  
 $D = (1,2,3,3)$   
The Minkowski distance between  
 $A \otimes B$  is  $3\cdot 98$ .  
The Minkowski distance between  
 $A \otimes C$  is  $8\cdot 43$   
The Minkowski distance between  
 $A \otimes C$  is  $\frac{3\cdot 33}{3\cdot 3}$   
The Minkowski distance between  
 $A \otimes C$  is  $\frac{3\cdot 33}{3\cdot 3}$   
The Minkowski distance between  
 $A \otimes C$  is  $\frac{3\cdot 33}{3\cdot 3}$   
The Minkowski distance between  
 $A \otimes C$  is  $\frac{3\cdot 33}{3\cdot 3}$ 

Problem :  
1) Given two Objects represented by the types  
(22, 1, 42, 10) and (20, 0, 36, 8)  
a) Compute the Exclident distance between two Objects  
b) Compute the Manhattan distance between two Objects  
c) Compute the Minkowski distance between the two  
Objects USNE P=3  
SOI : a) Exclident distance :  
(32, 11, 42, 10) (20, 0, 36, 8)  
= 
$$\sqrt{|22-20|^2+|1-0|^2+|42-36|^2+|10-8|^2}$$
  
=  $6\cdot71$ .  
b) Manhattan distance :  
(22, 11, 42, 10) (20, 0, 36, 8)  
=  $|22-20|^2+|1-0|^2+|42-36|^2+|10-8|^2$   
=  $11$ .  
(c) Minkowski distance :  
(122-20|^3+|1-0|^3+|42-36|^3+|10-8|^3)^{1/3}  
=  $6\cdot15$ 

(4) Hamming distance : Hamming distance is the number of values that are different between two vectors. It is typically used to Compare two binary storings of equal length It can also be used for storings to Compare how similar they are to each other by Calculating the number of Characters that are different from

Cach Other, portale application of the

(1) Find the Hammy distance between the  
Gade words off  

$$C = \begin{cases} (0000), (0101) (1011) (0111) \\ (0111)$$

D.

(5) <u>Chebysher</u> distance :-Chebysher distance is defined as the greatest Of difference between two vectors along any Goodinek dimension . In Otherwords, it is Simply the maximum distance Due to its nature, it is often refused as along One axis Chessboard distance since the minimum number of moves needed by a King to go from one square to anothing is equal to Chebyshev distance D (xiy) = Max ( | xi = yil) -) Consider two points Pi & P2 with Coordinates as follows  $R = (P_1, P_2, P_3 - - P_N)$   $B = (Q_1, Q_2, Q_3 - - Q_N)$ Then the Chebyshev distance between the two Faints PI & BL is (is Fik Chebysheu distance = Max (1Pi - 9;1)

(4) 1) The Point A has Goodinate (0, 3, 4, 5)and Point B has Goodinate (4, 6, 3, -1)The Chebyshev distance between Point A & B is  $d_{AB} = Max \left\{ 10 - 71, 13 - 61, 14 - 31, 15 + 11 \right\}$   $= Max \left\{ 7, 3, 1, 6 \right\} = 7$ . 2) distance  $(A,B) = Max (1X_A - Y_B |, 1Y_A - Y_B |)$  distance (A,B) = Max (170 - 3301), 140 - 2201) distance (A,B) = max (1 - 2601, 1 - 1881)distance (A,B) = max (260, 188)

(distance (AIB) = 260.

120/ ] ---- 1 - (P. 5/

(6) Jaccord Index: 100 The Jaccord distance measures the Similarity of the two data set sterns as the Intersection of those stems divided by the Union of the data sterns  $J(AB) = \frac{|AOB|}{|AUB|}$ where J = Jaccard distance To Calculate the Jaccard distance we Simply subtract the Jaccard index from 1' AUB) D(x1A) = 1. AUB

1 des

Hyperplane, Subspace & Halfspace (1) - Juperplane :hermetrically, a hyperplane is a geometric entity whose dimension is one less than that its ambient space. what does it mean? It means the following too example; If you take the 3D space then hyposphere is a geometoic entity that is 'I' dimensionless so its going to be di dimensions and a & dimensional entity in a 3D space would be a plane. Now If you take a dimensions, then 'I' dimensionless wordt be a Single- dimensional geometric entity, which would be a line and so on. (1) The hyperplane is Usually described by an equation as -follows Xn+b=01

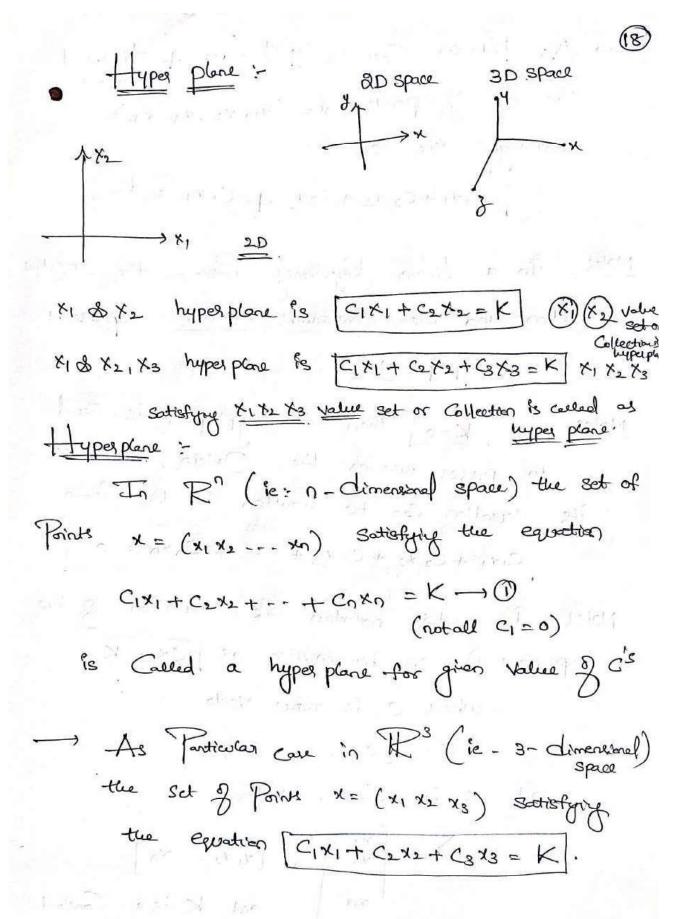

(a) If we expand this out for 'n' Variables we will get something like this X101 + X202 + X303 + - + Xn bann+b=0 (3) In just two dimensions we will get Something like this which is nothing but on equation and the state of the of a line X101 + X202 + b= 0. Ex: let us Consider a 20 geometer with  $n = \begin{bmatrix} 1 \\ 3 \end{bmatrix} \otimes b = 4$ Though it's a 2D geometry the Value of X  $\frac{|\mathbf{w}|}{|\mathbf{w}|} = \begin{pmatrix} \mathbf{x}_1 \\ \mathbf{x}_2 \\ \mathbf{x}_2 \end{pmatrix}$ So according to the equation of hypeoplane it Gn be Solved as  $x^{T}n + b = 0$  $\begin{bmatrix} \chi_1 \chi_2 \end{bmatrix} \begin{bmatrix} 1 \\ 3 \end{bmatrix} + 4 = 0$  $x_1 + 3x_2 + 4 = 0$ as you can see from the Solution the hyperplane is the equation of a line. So

(d) Dubspace: (16) Hyper - plones, in general, are not subspaces. However, If we have hyper-planes of the form XT0 = 0 That is if the plane goes through the Origin then a hyperplane also becomes a Subspace. (3) <u>Half -space</u>. -Consider this 2- dimensional Picture given below So here we have a 2-dimension in Xntb=0 space in X1 & X2 and as we have discussed before, the half & pore an equation in two dimensiones. would be a line which would of be a hyperplane. So the equation to the line is written as XTO + 6=0. So, for this two dimensione, we could write this line as we discussed Freviously X, n1 + X2 n2 + b= 0.

You Can notice from the above graph that this whole two-dimensional space is broken into two spaces. one on this side (the half of plane) of a line and the Other One on this side (-ve half of the plane) of a line. Now these two spaces are Called as Half-spaces Example: - Let us Consider the Same example that we have taken in hypesplane Case. so by solving, we got the equation as  $\begin{array}{c} x_1 + 3x_2 + 4 = 0 \end{array}$   $\begin{array}{c} x_1 + 3x_2 + 4 = 0 \end{array}$ There may arise 3 Cases Let's discuss each Case with on example. Case-1:  $x_1 + 3x_2 + 4 = 0 \rightarrow On$  the line. Let us Consider two points (-1,-1), when we put this value on the equation of line we got 'O' So we can say that this point is on the hyperplane of the line. a de la de la marte

日

is less than 'O' so we can Say is on the Negative Halfspace

Page 35 of 131

$$\rightarrow$$
 As Particular Case in  $\mathbb{R}^4$  (ie: 4 dimensional  
the set of points  $x = (x_{11}, x_{21}, x_{31}, x_{41})$   
Satisfying the equation  
 $C_1x_1 + C_2x_2 + C_3x_3 + C_4x_4 = K$ 

Notes: In a Linear Programmy Problem the Objective  
function and the Contrawn's equations suppresents  
the hyperplanes  
Notes: If 
$$[K=0]$$
 then the hyperplane is said  
to passes through the Openation, and then  
its equation Can be written in the form  
 $[C_{1}x_{1} + C_{2}x_{2} + C_{3}x_{3} + - + C_{1}x_{1} = 0]$   
Notes: In matrix notation the equation of the  
hyperplane (D) Can be written as  $[C_{1}x_{2} + K]$   
where C is some vector  
 $C = [C_{1}C_{2} - - C_{1}]$   
and x is Column vector  
 $X = \begin{bmatrix} x_{1}\\ x_{2}\\ \vdots\\ x_{n} \end{bmatrix} = \begin{bmatrix} x_{1}x_{2} - x_{1}\\ \vdots\\ x_{n} \end{bmatrix}$  and K is a Constration  
matrix

Geventioner Matrix = 
$$\frac{1}{6} \begin{bmatrix} 17.5 & 2.2 \\ 2.2 & 34 \end{bmatrix}$$
  
Geventioner Matrix =  $\begin{bmatrix} 2.92 & 3.67 \\ 3.67 & 5.67 \end{bmatrix}$   
Glautate the eigen Value and eigen vectors of the  
Colorince matrix  
 $\lambda$  fis on eigen Value for a modorx M  
Set fit is a solution of Chroateristic equation  
 $|M-\lambda T| = 0.$   
So, we have  
 $\begin{vmatrix} 2.92 & 3.67 \\ 3.67 & 5.67 \end{vmatrix} = 0$   
 $\begin{vmatrix} 2.92 - \lambda & 3.67 \\ 3.67 & 5.67 \end{vmatrix} = 0$   
There here  
 $(2.92 - \lambda) (5.67 - \lambda) - (3.67 + 3.67) = 0$   
 $16.56 - 2.92 \lambda - 5.67 \lambda + \lambda^{n} - 13.47 = 0$   
 $\lambda^{n} - 8.59 \lambda + 3.09 = 0$   
On Bolung this gladicatic expansion we get  
 $\lambda = 8.92, 0.38$ 

1

Thus two eigen values are (24)Y1= 8.22  $\lambda_2 = 0.38$ Clearly the second eigen value is very small Compared to the first eigen value so, the second eigen vector can be left out Eigen vector Grovesporday to the greatest eigen Value is the Principal Component for the given data set So we find the eigen vector Corresponding to eigen value X1 we use the following equation to find the Cigen vector MX=XX where M= Convasionee Motory  $\chi = Eign$  vector  $\lambda = Eigen Value$ On Substituting the values in the above equation we get  $\begin{bmatrix} 2 \cdot 92 & 3 \cdot 67 \\ 3 \cdot 67 & 5 \cdot 67 \end{bmatrix} \begin{bmatrix} \chi_1 \\ \chi_2 \end{bmatrix} = 8 \cdot 22 \begin{bmatrix} \chi_1 \\ \chi_2 \end{bmatrix}$ Solving these we get 2.92 ×1 + 3.67 ×2= 8.22 ×1 3.67 X1 + 5.67 X2 = 8.22 X2 on Simplification we get 

3.67 X1= 2.55 X2 ----- 2

## Page 47 of 131

(36) nincipal Component Analysis (PCA) is a statistical procedure that is used to reduce the dimensionality. It uses an Ontheogonal toonstonnation to Convert a Set of Observations of Passibly Greelated Variables into a set of Values of Linearly UnCorrelated Variables Called Principal Components It is often used as a dimensionality suduction technique . Steps involved in the PCA :-<u>Step-1</u>: Standardise the data set <u>Step-2</u>: Calculate the Covariance matrix for the features in the detaset. step-3: - Calwhate the eigen Values and eigen vectors for the Grasiance motory. <u>Step-4</u>: Sost eigen values and their Corresponding eign vectors. Step-5: pick k eigen values and form a

motory of eigen vectors

step-6: - transform the Orliginal matrix.

## Page 70 of 131

(37)Dimensionality Keduction :-Idvantages 2 Dimensionality reduction helps in data Compression, and hence reduced the storage space. (2). It reduces Computation time. (3) It also helps remove redundent features Of any. (4) Dimensionality Reduction helps in data Compressing and reducing the Storage space required. (5) It fasters, the time required for Peorboning Some Computations. (6) If there present fewer dimensions then it leads to less Computing. Altro dimensions con allow Usage of algorithms unfit for a large number of dimensions. It takes Care of multi Collinearity that impossed (7) the model fertormance. Et sumoves redundant features. for example, there is no point in storng a

Value in two different Units (meters & inches)

(8) Keducing the dimensions of data to &D or 3D may allow us to plot and Viscalize it Precisely. you can then Observe Patterns more clearly Below you can see that, how a 3D doda is Converted into 2D, First it has identified the ab plane then represented the points on these 1st Principal Component. two new axes Z1 and Z2. and principal Componet. 7 12 marth 14 12 in noise gremoust also and as Dt is helpful a gresult of that, we Gon impressue models. 11 Performance to a read of person and and in which our or wealth aspects where it section - should be made our public

38 Dis-advantages of Dimensionality Reduction :-(1) Basically, it many ked to some amount g data Coss. pcA tends to find linear Correlations (2) Attempt, between voorables, which is Sometimes undestrable (3) Also, PCA fails in cases where mean and Covariance are not enough to define datasets . (4) Further, we may not know how many Principal Components to Keep - in Practice Some thumb succes are applied.

## Page 73 of 131

Importance & Dimensionality Reduction: 1) why is Dimension Reduction is impostant in machine learning Reductive modeling? A) The Problem of unworted increase in dimension is closely related to Other. That was to fixation of measuring/ recording data at a fass granulas level then it was done in past. This is no way suggesting that this is a recent froblem. It has started gaining more impostance lately due to a surge in data. down H. wint?

Dis-advantages of Dimensionality Reduction:-1) It may lead to some amount of data loss a) PCA tends to find linear Correlations between Variables, which is sometimes undesirable. PCA fails in Cases where mean and Covariance 3) one not enough to define datasets. Advantages of Dimensionality Keduction :-1) It helps in data Compression and hence reduced Storage Space a) It reduces Computation time also helps serroue redundant features, If any 3) 14 ten ishdarah gilbaskeril  $\langle v_i - t \gamma v' \rangle = \langle j \in i \rangle |i|$ Machine Learning. Machine Learning is nothing but a field of study which allows computers to "Learn" like humans without any need of explicit Programming. all every second to be the property and that (a) other basis handlingthe orlands to

What is Predictive totodeling :-Predictive modeling is a Probabilistic Process that allows us to forecast outcomes, on the basis of Some Predictors. These Predictors are basically features that Gome into play when deciding the final gresult le: the Outcome of the Model. result tout for What is Dimensionality Reduction ? In machine learning classification Problems, there are often too many factors on the basis of which the final Classification is done. These factors are basically variables called features. , Journal posisol The highes the normber of features, the hardes it gets to visualize the toany set and then work on it.

Sometimel most of these features are Correlated and hence redundant. That is where dimensionality reduction algorithms Come into play. Dimensionality reduction is the Proceed of reducing the number of random varsiables Under Consideration, by Obtaining a set of Principal Varsiables. It can be divided into feature selection and feature extraction.

Components of Dimensionality Reduction: -There are two Components of dimensionality reduction

i) <u>Feature Selection</u>: In this, we toy to find a subset of the Original set of Uniables, or features, to get a smaller subset which can be Used to model the Problem

It usually involves Three Ways. 1) Filter

- 2) wrappes
- 3) Embedded.

a) <u>feature</u> Extraction: This reduces the data in a high dimensional space to a lower dimension space

re: a space with lesses no of dimensions.

## Page 77 of 131

for Metude of Dimensionality Reduction. The various methods used for dimensionality reduction include (1) Principal Component Analysis (PCA) 2) Linear Disconninant Analysos (LDA) 3) Cheneralized Discontinant Analysis (GDA) Dimensionality suduction may be both lineag or non-Linear, dependant upon the method used. or it call to b tobe at part was what all a relation to prestine F a and withink is the Parisin D and go fulled . ind to disclot presente presente a top at the second mention will present beers - standar analt - statedant patients 19 Polist 0 Popperio (1) Pelision (F which all produce produce replaced to be that it species and a straight produced appeal a restatistical property allow using a set

Initial Component Analysis (or) PCA is a dimensionality reduction motual that is often used to reduce the dimensionality of large data sets, by toonsfoorning a large set of Vaniables into a smaller One that still Contains most of the infoornation in the Large set.

-> Based on the dataset find a new set Z Ontrigonal feature vectors in such a way that the data spread is maximum in the director Z the feature vector (or) dimension.

per deres - manete (H) Covasionce Formula. sand to the state Covariance fornula is a Statistical fornula which is used to assess the neletionship between two vorables. In simple words, Covariance is one of the Statistical measurement to know the relationship 3 the variance between the two variables. The Covariance indicates how two variables are related and also helps to know whether the two vasiables vary together or change The Covassionce is clenated by Cov(X,Y) and together. the formula of Covaratance are given below Population Coversionce formula.  $C_{ov}(x,y) = \frac{\leq (x_i - \overline{x})(y_i - \overline{y})}{N}$ Sample Covariance formula:  $C_{v}(x,y) = \leq (x_i - x)(y_i - y)$ N-1 These are the -formulas to find sample and Population Grossionce.

Chrom Schmidt - This Process is used to Convert set of all Ordinary vectors into Onthonormal vectors The Street Agenes -) Orthogonal vectors. The vectors VI. V2.... Vn are Said to be Ortugonal If the inner Product of any two different vectors equals to Zero.  $\frac{ie}{1} < v_i \cdot v_j > = 0 \quad \forall \quad i \neq j$ (Inner Fooduct (or) dot Roduct) ---- The Brom- Schmidt Frocess (or Procedure) is a sequence of operations that allow us to toansform a set of Linconly independent Vectors into a set of Orthonormal vectors. - The Bron schmidt Process is used to toonstoom a set of linearly independent vectors into a set of Orthonormal vectors formul Orthonormal basis. an San . in film is proved and

Let ry

-) The Gron schmidt algorithm makes it Possible to Constauct, for each list of linearly independent vectors (basis), a Corresponding Orthonormal list (Orthonormal basis) -) we say that 2 vectors are Ortugonal If they are I'r to each other ie: The dot Foduct of the two vectors is Zero.

Variable:-

A variable is a quality which changes or variesthe change may occur due to time factor or any -factor.

Eq: - Height of the person with age, Height and weight of the person.

Variable is of a types:

1) Discrete 2) Continuous

Random Variable:-

A real variable & whose value is determined by the outcome of a random experiment is called a random variable. Random variables are two types

D Discrete Random Ubriabile

2) Continuos Pardom Variable

1) Discrete Random Variable:-

A random Variable X which can takes only a finite number of discrete values in an interval of domain is called a discrete random variable.

Sec. 8-98 1

29: Tossing of coin, Tossing of die etc.

a) Continuous Random Uniable:

A random variable & which can take values continuosly then the variable is called continuos random variable.

Eq:- Semperate, Time, Holghe, Age etc.

Probability function of a discrete random variable: If for a discrete random variable "x" the real value function P(x)

i.e. p(x=x) = p(x)

$$F_{xx} perties::$$
(i)  $p(x) \ge 0$

Number of simple items selected  $= 4$   
Number of  $simple$  items  $selected = 4$   
Number of  $simple$  items  $selected = 4$   
 $\sqrt{1} = 2 + \frac{12}{4} + \frac{1$ 

Let x denote the number of defective items. Number of defective items = 5 Number of good items = 7 The required probability of getting defective items as follows:  $P(x=0) = \frac{5c_0 \times 7c_4}{12c_4} = \frac{7}{99}$  $P(X=1) = \frac{5C_1 \times 7C_3}{12C_4} = \frac{35}{99}$  $P(x=2) = \frac{5C_2 \times 7C_2}{12 C_4} = \frac{42}{99}$  $P(x=3) = \frac{5C_3 \times 7C_1}{12c_4} = \frac{14}{99}$  $P(x=4) = \frac{5c_4 \times 7c_0}{12c_4} = \frac{1}{99}$ Х D 4 1 2 3 P(x) 7 35 42 14 すう 99 99 99 99 ation bate to te Expected Value = E(x) = = Pixi  $= 0 + \frac{35}{99} + \frac{84}{99} + \frac{42}{99} + \frac{4}{99}$  $=\frac{165}{99}=\frac{5}{3}=1.667$ 

<sup>5)</sup> A Sample of 3 items is selected at random from a box containing 10 items of 4 are defective. Find the expected Value. Sol:-Total number of items = 10. No. of Sample items selected = 3 Number of ways selected from 10 of  $3 = 10_{c_3}$  $10_{c_3} = 120$  Number of good items=6 Number of defective=4 Let x be denote number of defective The required probabilities are as follows:

$$P(r, v) = \frac{410}{10c_s} = \frac{1}{6}$$

$$P(x_{21}) = \frac{4.C_1 \times 6C_2}{10_{C_3}} = \frac{1}{2}$$

$$P(x=2) = \frac{4c_2 \times 6c_1}{10c_3} = \frac{3}{10}$$

$$P(x=3) = \frac{4C_3 \times 6C_0}{10C_3} = \frac{1}{30}$$

x	0	1	2	3
P(x)	-1-	1-1-2	3	i 30

$$E \times pected \quad Value = E(x) = \sum_{i=0}^{3} p_i \times i$$
  
=  $0 + \frac{1}{2} + \frac{6}{10} + \frac{3}{30}$   
=  $\frac{1}{2} + \frac{3}{5} + \frac{1}{10}$   
=  $0.5 + 0.6 + 0.1$ 

6) Find the mean of the probability distribution of
-the number of beacle obtained in tossing 3 coins.
Sol:- Let X denotes the number of beacles
Humber of coins tossed at a time = 3
Total possibilities = 3<sup>5</sup> = 8
The required probability distribution is as
follows:

ned v St.

$$\begin{aligned} \left[ \begin{array}{c} x & 0 & 1 & 2 & 1 & 5 \\ \hline p(x) & 1/8 & 3/8 & 5/8 & 1/8 \\ \end{array} \right] \\ & Expected Value = E(x) = \frac{3}{8} + \frac{6}{8} + \frac{9}{8} \\ & = \sqrt{9} \text{ NN} = \frac{12}{8} + \frac{3}{2} = 1.5 \\ \hline (\text{ontinuos probability distribution:} \\ \text{ Let } f(x) be a continuous function in the intermal (a,b) is called continuous probability distribution. It is denoted by  $\int f(x) dx$ .  
properties:-  
1.  $f(x) \ge 0$   
a  $\int f(x) dx = 1$   
3.  $P(a \le x \le b) = \int f(x) dx$ .  
Curonalative distribution function of a continuous readom variable:-  
 $F(x) = P(x \le x)$ .  
 $= \int f(x) dx$ .  
Properties:-  
1.  $0 \in F(x) \le 1$   
 $\therefore F(x) = 0$   
 $4: F(x) = 1$   
Measures of central tendency for continuos probability distribution:-  
 $\mathcal{M} = E(x) = \int x \cdot f(x) dx$ .  
Median:- Median is the point, which divides the entire$$

distribution in to two equal parts. Suppose The mathematical point is taken as M then  

$$\int_{a}^{b} F(x) dx = \int_{a}^{b} f(x) dx = \frac{1}{2}$$
Here  $[a_{1}b]$ 
Model: Made is the value of x for which  $f(x)$  is maximum. Made is calculated by  $F'(x) = 0$ ,  $f'(x) < 0$   
for a  $x < x < b$ .  
Variance: Variance  $= 2$ ,  $\int_{a}^{b} x^{2} f(x) dx - \mu^{4}$   
Standard deviation:  
 $s \cdot D = = \sqrt{Var(x)}$   
 $= \sqrt{\int_{a}^{b} x^{2} f(x) dx - \mu^{2}}$   
Mean deviation about the mean  $\mu$  is given  
by  $\int_{-\infty}^{b} [x - \mu] f(x) dx$ .  
F) If a continuous random variable has the probability  
density function  $f(x)$  has  $f(x) = \int_{a}^{b} z^{2x} f(x x < 0$ .  
That the probabilities  
(i) between 1 and 3 (ii) greater than 0.5 (i) =  
 $f(x) = \int_{a}^{b} (x^{2} - x) = \int_{a}^{b} f(x) dx$ .  
 $f(x) = \int_{a}^{b} z^{2x} f(x) dx$ .  
 $f(x) = \int_{a}^{b} z^{2x} dx$   
 $f(x) = \int_{a}^{b} z^{2x} dx$ 

$$= 2 \left[ \frac{e^{-2x}}{-2} \right]^{3}$$

$$= 2 \left[ \frac{e^{-2(x)}}{-2} - \frac{e^{-2(x)}}{-2} \right]$$

$$= \frac{2}{-2} \left[ e^{6} - e^{2} \right]$$

$$= - \left[ e^{-6} - e^{2} \right]$$

$$= e^{-2} - e^{-6} = 0.13.2$$

$$(ii) p(x > 0.5) = \int_{-7}^{\infty} f(x) dx$$

$$= \int_{-2}^{\infty} de^{-2x} dx$$

$$= \int_{-2}^{\infty} de^{-2x} dx$$

$$= 2 \left( \frac{e^{-2x}}{-2} \right)_{0.5}^{\infty}$$

$$= - (e^{-\infty} - e^{-1})$$

$$= - [0 - e^{-1}]^{2}$$

$$= \frac{1}{e} = 0.367$$

8) The probability density function 
$$-f(x)$$
 of a continuous  
variable is given by  $-f(x) = ce^{-|x|}, -\infty < x < \infty$ .  
To find (i) c (ii) Mean (iii), Variance (iv)  $P(0 < x < 4)$   
Sol:- Given,  
 $f(x) = ce^{-|x|}$   
We know that  $\int -f(x) dx = 1$   
 $-\infty$   
 $\int_{0}^{\infty} ce^{-|x|} = 1$   
 $-\infty$   
 $\int_{0}^{\infty} ce^{-|x|} = 1$   
 $-\infty c \left[ e^{-x} dx = 1 \right]$   
 $-\alpha c \left[ e^{-x} - e^{-0} \right] = 1$   
 $-\alpha c \left[ e^{-x} - e^{-0} \right] = 1$   
 $-\alpha c \left[ e^{-x} - e^{-0} \right] = 1$   
 $-\alpha c \left[ e^{-x} - e^{-x} \right] = 1$ 

Here 
$$f(x) = \frac{1}{2} e^{-|x|}$$
  
(ii) Mean:-  
 $\mu = \int_{-\infty}^{\infty} x f(x) dx$   
 $= \int_{-\infty}^{\infty} x \frac{1}{2} e^{-|x|} dx$   
 $= \frac{1}{2} \left[ \int_{-\infty}^{\infty} x e^{-|x|} dx \right]$   
 $\mu = 0$  since it is an odd function.  
(iii) Variance  $e^{-2} = \int_{-\infty}^{\infty} x^{2} f(x) dx - \mu^{1}$   
 $= \int_{-\infty}^{\infty} x^{2} \frac{1}{2} e^{-|x|} dx$   
 $= \int_{-\infty}^{\infty} x^{2} \frac{1}{2} e^{-|x|} dx$   
 $= \int_{0}^{\infty} x^{2} \frac{1}{2} e^{-|x|} dx$   
 $= x^{2} \frac{1}{2} e^{-x} dx$   
 $= x^{2} \frac{1}{2} e^{-x} dx$   
 $= (x^{2} e^{-x})_{0}^{\infty} - x \left[ \left[ x e^{-x} \right]_{0}^{\infty} + \left[ e^{-x} \right]_{0}^{\infty} \right]$   
 $= -x \left[ e^{-x} - e^{-x} \right]$ 

-3

$$= \frac{1}{\alpha} \left[ e^{-x} - 1 \right]$$

$$= \frac{1}{\alpha} \left[ 1 - e^{-x} \right]$$

$$= D \cdot 4906.$$
  
The probability density -function of a xarchom variable  $\frac{1}{2} \sqrt{16}$  find  $d \in E(x)$  (ii)  $E(x^{2})$   
 $f(x) = \begin{cases} e^{-x}, n \ge 0$  (iii)  $Var(x)$  (iv) Standard of  $0, otherwoise$  deviation.  
(i)  $E(x) = \int_{-\infty}^{\infty} x e^{-x} dx$   

$$= \int_{-\infty}^{\infty} x (o) dx + \int_{-\infty}^{\infty} x e^{-x} dx$$

W. SILF

1) Discrete theoretical customers  
In this we study Binomial, poisson distribution  
s) centimues theoretical distributions:-  
In this we study alonnal. Uniform, Exposential  
distributions:  
Demoulli Distribution:-  
A vandom Variable X which takes two values  
and I with probability P and q respectively i.e.  

$$P(x) = 1 = P$$
  
 $P(x) = 0 = Q$   
 $q = 1 - P$ , is called Bernoulli. Distribution.  
This is shown as  
 $P(x) = p^{x}q^{1-x}$  (where  $x = 0, 1$ )  
 $= p^{x}(1-P)^{1-x}$   
Bernoulli's Theorem:-  
 $P(x=x) = n_{cy}p^{y}q^{n-y}$   
where  $p+q=1$   
Binomial Distribution:-  
It was discovered by Immes Bernoulli' in the  
year 1700 and it is a discrete probability distributes  
Eq: Tossing of a coin, Birth of baby.  
Definition:-  
A random Variable X has a binomial distribution  
if it assumes only non negative Values and its  
 $P(x=y) = n_{cy} p^{x}q^{n-y}$  (where  $y=0, j, z...n$ )

Conditions of Binomial Distribution:  
There are n independent trails facto trail has two  
possible outcomes. The probabilities of two outcames  
are constant.  
Mean 
$$Df$$
 the Binomial Distribution:  
Mean  $U = np$   
We know that the Binomial distribution  
 $P(r) = n_{cr} p^{r}q^{n-r} (reo_{1/2}...n)$   
Mean  $U = \sum_{r=0}^{2} r n_{cr} p^{r}q^{n-r}$   
 $= 0 + n_{cl}pq^{n-1} + a h_{c2}p^{2}q^{n-2} + ... + D \cdot h_{cn}pq^{r}$   
 $= n \cdot pq^{n-1} + a \cdot \frac{n(n-1)}{a} p^{2}q^{n-2} + ... + np^{n}$   
 $= np(q+p)^{n-1}$   
 $= np(q) = np_{ll}$   
Variance of Binomial Distribution:  
 $q^{2} = npq$   
We know that  $p(r) = ncr p^{r}q^{n-r} (reo_{rl,2}...n)$   
Variance  $= \sum_{r=0}^{2} r^{2}p(r) - (u)^{2}$   
 $= \sum_{r=0}^{n} (r(r-1))p(r) + \sum_{r=0}^{2} r(r) - n^{2}p^{2}$   
 $= \sum_{r=0}^{n} r(r-1)p(r) + \frac{n}{r}p^{2}$   
 $= \sum_{r=0}^{n} r(r-1)p(r) + \frac{n}{r}p^{2}$   
 $= \sum_{r=0}^{n} r(r-1)n_{cr} p^{2}q^{n-3} + ... + n(n-0)n(n)^{2}q^{p})$   
 $+ np - n^{2}p^{2}$ 

$$= \left[ (2)(1) \frac{n(n-1)}{2} p^{2}q^{n-2} + (2)(2) \frac{n(n-1)(n-2)}{2} p^{2}q^{n-3} + \dots + n(n-1)p^{n} + np - n^{2}p^{2} + n(n-1)p^{2} \left[ q^{n-2} + (n-2) pq^{n-3} + \dots + p^{n-2} \right] + np - n^{2}p^{2}$$

$$= n(n-1)p^{2} \left[ q^{n-2} + (n-2) pq^{n-3} + \dots + p^{n-2} \right] + np - n^{2}p^{2}$$

$$= n(n-1)p^{2} (q+p)^{n-2} + np - n^{2}p^{2}$$

$$= n(n-1)p^{2} + np - n^{2}p^{2}$$

$$= np(1-p) = np(2q) = npq_{1}$$

$$= np(1-p) = np(2q) = npq_{2}$$

$$= np(1-p) = np(2q) = npq_{1}$$

$$= n^{2} = np\gamma_{1}$$
Mede of the Binomial Distribution:-  
Made of the binomial distribution is the value q  
is at ublich  $p(x)$  is manuforum value.  
Mode =  $\left\{ (n+1)p \right\}$  if non-integer  
 $(n+1)p$  and  $(n+1)p_{-1}$  if integery  
Recumance Relation for Binomial Distribution :-  
 $p(r+1) = \frac{(n-r)p}{(r+1)q} p(r)$ 
Proof:  
By Binomial distribution we have  
 $p(r) = ncr p^{2}q^{n-r} \longrightarrow 0$   
 $p(r+1) = ncr_{r+1}p^{r+1}q^{n-r-1}$ 

$$= ncr_{r+1}p^{r+1}q^{n-r-1}$$

$$= \frac{(n-r)p^{r+1}np^{r+1}q^{n-r-1}}{ncrp^{r}q^{n-r}}$$

$$= \frac{(r+r)p}{rr}pq^{r} = \left(\frac{n-r}{r+1}\right)\frac{p}{q} m^{r}$$

$$= \frac{n-r}{r+1}pq^{r} = \left(\frac{n-r}{r+1}\right)\frac{p}{q} m^{r}$$

$$= \frac{n-r}{r+1}pq^{n} = \left(\frac{n-r}{r+1}\right)\frac{p}{q} m^{r}$$

1. A fair coin is tossed 6 times. Find the probability of getting 4 heads. Given n=6. p=probability of getting a heads= 1/2 q=1/2 r=4 heads  $P(x=r) = p(r) = n cr p^{r} q^{n-r}$  $P(4) = 6c_4 \left(\frac{1}{2}\right)^4 \left(\frac{1}{2}\right)^{6-4}$  $= 6_{\ell_{4}} \cdot \frac{1}{2^{\prime_{4}}} \cdot \frac{1}{2^{\prime_{2}}}$  $=\frac{15}{26}=\frac{15}{64}/1$ 2. 10 Coins are thrown simultaneously. Find the probability of getting (i) atleast 7 heads (ii) 6 heads Given n= 10 coins  $p = \frac{1}{2} \quad q = \frac{1}{2}$  $p(r \ge 7) = p(r = 7) + p(r = 8) + p(r = 9) + p(r = 10)$  $= 10_{c_{7}} \left(\frac{1}{2}\right)^{7} \left(\frac{1}{2}\right)^{10-7} + 10_{c_{8}} \left(\frac{1}{2}\right)^{8} \left(\frac{1}{2}\right)^{10-\frac{9}{4}}$  ${}^{10}C_{9}\left(\frac{1}{2}\right)^{9}\left(\frac{1}{2}\right)^{10-9} + {}^{10}C_{10}\left(\frac{1}{2}\right)^{10}\left(\frac{1}{2}\right)^{10-10}$  $=\frac{176}{1024}$ =0,171 (ii)  $P(y \ge 6) \rightarrow p(y \ge 6) + p(y \ge 7)$ ⇒ ng (±)<sup>6</sup>(±)<sup>10-6</sup>+0.171 ⇒0.376/1. 3. The mean and Variance of binomial distribution of 4 and :413 respectively. Find p(x>1). Given mean u=np=4 ->0

Variance 
$$=2 \operatorname{enpq} = 4/3 \longrightarrow \mathfrak{S}$$
  
So  $\frac{\mathfrak{S}}{\mathfrak{O}} = \frac{\mathfrak{npq}}{\mathfrak{np}} = \frac{\mathfrak{a}/\mathfrak{s}}{\mathfrak{a}} = \frac{\mathfrak{s}}{\mathfrak{s}}$   
 $q = \frac{\mathfrak{s}}{\mathfrak{s}}$   
 $p = 1-q \Rightarrow 1-\frac{\mathfrak{s}}{\mathfrak{s}} \Rightarrow p = 2/3$   
Also  $\operatorname{np} = 4$   
 $\operatorname{n}(\frac{\mathfrak{s}}{\mathfrak{s}}) = 4$   
 $\operatorname{n} = 6$ .  
i.e.  $\operatorname{n=6}, p = 2/3, q = \frac{1}{3}$   
 $p(x > 1) = 1-p(x=0)$   
 $= 1-6C_0(\frac{\mathfrak{s}}{\mathfrak{s}})^2(\frac{1}{\mathfrak{s}})^6$

=  $I - \left[ 0.039 + 0.156 \right]^{7}$ 

$$= 1 - 0.195$$
  
= 0.805  
(iv)  $P(x \ge 1) = 1 - P(x = 0).$   
=  $1 - 8c_0 (-\frac{1}{5})^{\circ} (-\frac{1}{5})^{\circ}$   
=  $1 - 0.039$ 

Poisson Distribution:-

"This is interoduced by SD poisson in 1837. The poisson distribution can be derived as a limiting case of binomial distribution under following conditions: in The probability of occurance of event is very small as n is very large

Definition of poisson distribution:

$$P(X=x) = \begin{cases} \frac{e^{-1} A^{x}}{x!} & \text{where } x = 0, 1, 2, 3...\\ 0 & \text{Otherwise} \end{cases}$$

Mean of the poisson distribution: Mean  $\mathcal{H} = \mathbb{E} \times p(\mathbf{x})$   $\mathbb{E} \mathbb{E} \times \left(\frac{\mathbb{E}^{-1} \mathcal{A}^{\times}}{\mathbb{E}^{1}}\right)$  $= \mathbb{E}^{-1} \left[\mathbb{E} \times \mathcal{A}^{\times}\right]$ 

$$= e^{-\lambda} \left[ \frac{\sum x \lambda}{x(x-i)!} \right]$$
  
=  $e^{-\lambda} \left[ \frac{\lambda}{1} + \frac{\lambda^2}{1!} + \frac{\lambda^3}{2!} + \dots \right]$   
=  $e^{-\lambda} \left[ \frac{\lambda}{1} + \frac{\lambda^2}{1!} + \frac{\lambda^3}{2!} + \dots \right]$   
=  $e^{-\lambda} \lambda \left[ 1 + \frac{\lambda}{1!} + \frac{\lambda^2}{2!} + \dots \right]$   
=  $e^{-\lambda} \lambda e^{-\lambda} \left[ e^{-\lambda} = 1 + \frac{\lambda}{1!} + \frac{\lambda^2}{2!} + \dots \right]$ 

Variance of poisson Distribution:-Variance  $c^2 = \sum x^2 p(x) - u^2$   $= \sum x^2 \frac{e^{-d} x}{x!} - d^2$   $= \sum \frac{xe^{-d} x}{(x-1)!} - d^2$  $= e^{-1} \left[ \sum \frac{((x_1+1)+1)}{(x+1)!} + x^2 \right] - d^2$ 

$$= e^{-A} \left[ \sum_{i=2}^{\infty} \frac{(x-i)A^{x}}{(x-i)!} + \frac{\sum_{i=1}^{\infty} \frac{A^{x}}{(x-i)!}}{(x-i)!} \right] - A^{2}$$

$$= e^{-A} \left[ \sum_{i=2}^{\infty} \frac{A^{x}}{(x-2)!} + \frac{\sum_{i=1}^{\infty} \frac{A^{x}}{(x-i)!}}{(x-i)!} \right] - A^{2}$$

$$= e^{-A} \left[ \left[ \frac{A^{2}}{1} + \frac{A^{2}}{1!} + \frac{A^{4}}{2!} + \cdots \right] + \left[ \frac{A}{1!} + \frac{A^{2}}{2!} + \frac{A^{3}}{2!} + \cdots \right] \right] + A \left[ \frac{A}{1!} + \frac{A^{2}}{2!} + \frac{A^{3}}{2!} + \cdots \right] + A \left[ 1 + \frac{A}{1!} + \frac{A^{2}}{2!} + \cdots \right] = A^{2}$$

$$= e^{-A} \left[ A^{2} \left( 1 + \frac{A}{1!} + \frac{A^{2}}{2!} + \cdots \right) + A \left( 1 + \frac{A}{1!} + \frac{A^{2}}{2!} + \cdots \right) \right] = A^{2}$$

$$= A^{2} + A - A^{2}$$

$$= A^{2} + A - A^{2}$$

Vanance = 1

scentralisters assessed Mode of the poisson Distribution:

Mode of the poisson distribution lies between (4,-1) & 1

Note: If I is integer then we have 2 modes i.e. 1-1 & A. If I is not integer then mode is integer part of 1.

11

Recumance Relation for poisson distribution:  $P(x+1) = \frac{\lambda}{(x+1)} P(x)$ 

-> Average number of accidents on any day on a national highway is 1.8. Determine the probability that the number of accidents are ci) atleast one cii) atmost one EV. YOURTH Soll- Given Mean = Average - 1=1.8 By poisson distribution;  $P(x=x) = \frac{e^{-1}A^{x}}{x!}$

Normal Distribution: Normal distribution was first discovered by De Moivre in 1733 and further developed by loplace and Gause. This is known as Gaussian distribution. It is limiting form of Binomial distribution of large values of n when p and q are not very small. Definition of normal distribution:

$$f(\chi, \mu, \sigma) = \frac{1}{\sigma \sqrt{R\pi}} e^{\frac{-(\chi-\mu)^2}{R\sigma^2}}$$

-00 < x < 00, - 00 < U < 00, ->0.

Note: In Normal distribution means medians mode. characteristics of normal distribution:

i) The shape of the graph of the normal distribution is bell shaped

2) Area under the normal curve represents the total population.

3) Mean, median and mode are coincide at middle of the curve,

4) The n-anis never touches the curve.

5) Area under the normal curve is distributed as follows !!! 68.2.1.1.

al topant the File of period of THE a subscription of the date of M

6) Area of normal curve between u- - and u+is 68.27%. the second of the second of

- ticnet

7) Area of normal curve between u- 20 and ut20 is 1 C Property 1 and 12 12 95.43%.

8) Area of normal curve between 11-3- and 11+3- is 99.95%

The normal distribution with means used and Standard Norriu Standard deviation == 1 then it is called standard normal distribution. Uses of Normal distribution:

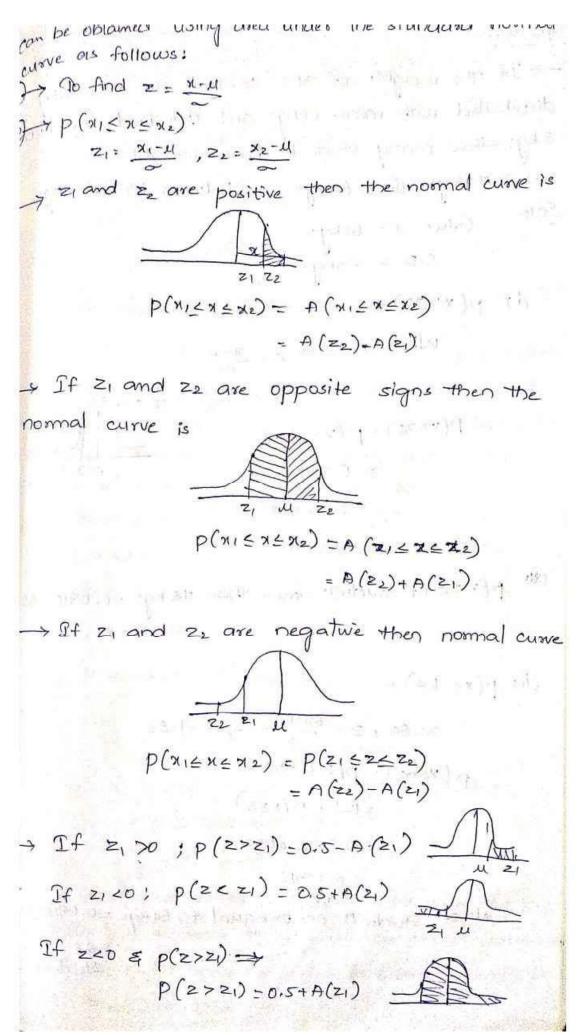

The normal distribution can be used to approximat Binomial & poisson distribution.

-> It helps us to estimate parameter from statisty and to find confidence limits to the parameter. - It is widely use in to test the hypothesis and test the significance of the population.

Importance & Applications of Normal distribution: Normal distribution plays a very important mole in statistical theory because of the following reasons -> Data obtained from psychological, physical & Bilogical measurements approximates follows normal distributions.

kg:- Height & weight of individuals, IPL score's Will CP-Normal distribution is limiting case of Binomial and poisson distribution. It is used to approximate for many applied problems in different branches. It is used to approximate any statistic value. It is used in sqc -> statiscal quality control in industr tor finding control limits. 1. 53. 54 Find the probability Density of Normal Curve: Dayfe G The probability that the normal variant x with

Stochastic Processes and Markov Chains Interduction :means "Rondom" (or) "Chance" Stochastic Analysis deals with models which involve uncertainties on standomness. r. Cartel A mondan Variable is a surle (or function) that assigns a great number to every outcome of a stordom experiment, while a stordom Process is a sule (or a function) that assigns a time function to every outcame of a stordom expersiment. Stochastic (Pardon Process): Def: A stochastic (or random) Process is defined as a Collection of mondam Variables { X(tn); n=11213---- 3 0 1000 100 The grandom Variable X(t) stands for Observation and shat time it of although with strategy . The number of states, 'n' may be finite (or) Infinite depending upon the time glonge.

For example the Poisson distribution  $P_{n}(t) = \frac{e^{-\lambda t} (\lambda t)^{n}}{n!}, n = 1, 2, 3 - \cdots$ Represents a stochastic (or stondom) Process with infinite number of states. Here the grandom Variable 'n' denotes the number of Occurrences between the time interval O and t (assuming that the system starts at 0 times). Thus the states of the system at any time t'are given by n=0,112 ----Markov Process Definition: Stochastic (or random), System is called a Markov Process Of the Occurence of a foture state depends on the immediately frecedy state and Only on it. Signa : Calix , Thus If to <t1 < .. <tn represents the points in time scale then the family of Mandam Variables { X(th)} is Said

to be a Markov Process Forvided it holds the Markovian Property.  $P\left[X(t_{n}) = x_{n} / X(t_{n-1}) = x_{n-1}, \dots, X(t_{n}) = x_{n}\right]$ =  $P\left[X(t_n) = x_n / X(t_{n-1}) = x_{n-1}\right]$ Markov Process is a Sequence of 'n' exposiments in which each experiment has 'n' possible OutComes X1X2 -- - Xn. Each individual OutGone is Called a state and the Probability ( that a Particular octame occurs) depends only on the Porbability of the Outcome of the precedity experiment. Characteristics of Markov Process :-Markov analysis is based on the following Characteristics :-----(1) The states are both Collectively exhaustive mit ( and motively exclusive . (2) The Problem must have a finite number of States, none of them " absorbing " in nature.

(3) The toonsition probabilities are stationary (A) The Probability of moving form One state to another depends only on the immediately Precedy state. (5) The toonsition Probabilities of moving two alternatives states in the next time Period, given a state in the Current time Period musit sure to Unity. (6) The Process has a set of initial Probabilities that may be either given or determined. 1 - 1 - 1 - 1 - 5 ronvition Poobability : Def: The Probability of moving form one state to another or remaining in the some state during a single, time period is called Transition Frobability likes of styles and the Mathematically the Probability politional ere approvidently  $f_{x_{n-1},x_n} = P\left[X\left(t_n\right) = x_n \left|X\left(t_{n-1}\right) = x_{n-1}\right|\right]$ Called the Transition Probability the gentriant Care hall 121

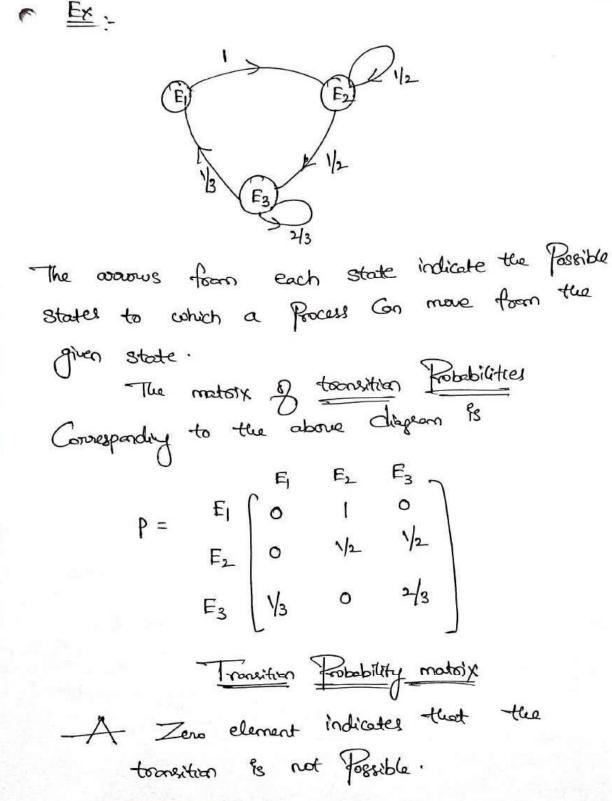

This Conditional Probability is known as 3 Que step transition Probability, because it describes the system during the time internof (tn-1, tn) . Since each time a new result occurs, the Process is said to have stepped or incremented One step. Here 'n' indicates the number of steps If n=0; it represents the initial state. or increments. Transition Probability Mateix :-The toonsition Probabilities can be arranged in a materix from and such a matorix is called

a <u>One step</u> toonsition <u>Probability motory</u> denoted by  $P = \begin{pmatrix} R_1 & R_{12} - - - & R_{1m} \\ R_{21} & R_{22} - - - & R_{2m} \\ R_{m_1} & R_{m_2} - - & R_{mm} \end{pmatrix}$ 

The matrix p is a Square motorix whose each element is non-negative and sum of elements\_? Each row is Juity.

In general, any matrix P, whose elements are non-negative and sum of elements either in each slow or Column is Unity is called toonsition mateix or a Robability mateix. a Thus a toonsition matorix is a square stochastic materix and it gives the Complete description of the Markov Process. Diagrammatic representation of toonextion probabilities Fransitivan Chingson :-It shows the toonsition Probabilities (or) shifts that can occur in any Particular Solution . Ex : 23 game quarter Sinterer own Charles and the second mound to make ters strager was it burned" the git cause dates

## Page 9 of 51

First and Higher Order Markov Frocessels The First Order markov Process is based on the following three assumptions (1) The set of Possible outcomes is finite (2) The Robability of the next outcome depends only on the immediately Preceding at Come. (3) The toonsition Robabilities are Constant over time. J depends on Precu stop. x0-1 x0 x0+1 and an and a start The Second Order markov Process assumes that the Probability of the next outcome state may depend on the two Revious outcomes. Likewise a Third Order markov Process assumed that the Robability of the next outcome state Con be alwheted by Obtaining and taking account of the Outcomes of the past three outcomes.

Page 10 of 51

<u>n-step</u> teansition Probabilities :-Suppose the system which occupies the state Et at time t=0, then we may be interested in finding out the Probability that the system moves to the state Ej at time t=n (these time Periods are referred to as number of steps) If the n-step tooneition Probability is denoted by Pij<sup>(n)</sup>, then these Probabilities Can be suppresented in materix form as given below  $P^{(n)} = \begin{bmatrix} E_1 & E_2 & \cdots & E_m \\ P_{11}^{(n)} & P_{12}^{(n)} & \cdots & P_{1m} \\ P_{21}^{(n)} & P_{22}^{(n)} & \cdots & P_{2m}^{(n)} \\ \vdots & \vdots & \vdots \\ E_m & P_{m_1}^{(n)} & P_{m_2}^{(n)} & \cdots & P_{m_m}^{(n)} \\ \end{bmatrix}$ Hore, for example (P21) means the probability that the system which occupies state F2 will move to the state El after n steps. Markov Chain - Interduction :-G Let Pi<sup>(o)</sup> (j=0,1,2---) be the absolute Probability Such that the system be in state Ej at time to where Ej (j=0,1,2,3---) denote the exhaustive and mutually exclusive outcomes of a system at any time. ve define  $P_{ij} = P[X(t_n) = j / X(t_{n-1}) = i]$ as the One-step toonexition Probability of going forn state i at time ton and to state 1 at It is also assumed here: that there time to. Probabilities from state  $E_i$  to state  $E_j$  ( $i=0,1,2-\cdots$ ) are expressed in the matrix form as follows.  $P = E_0 \begin{pmatrix} E_0 & P_{01} & P_{02} & - & - & - \\ P_{10} & P_{11} & P_{12} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{22} & P_{22} & P_{22} & P_{22} & P_{22} & - & - & - \\ P_{20} & P_{21} & P_{$ the stand of the This motor x, p is known as stochastic materix (OE) Homogeneous mately, The Probabilitues Pi musi- stor Satisfy the boundary Conditions <u>Episel</u> Hand Ry Zo. Hisj

Definition :-Markov Chain :-The transition motorx p as defined above, together with the initial Robabilities & p. (0) y associated with the state Ej (j=0,11,2--) Completly define a master Chain. The markov Chain are of two types (i) esgodic matter chain (ii) segular matter chain (i) Egodic matrice chain:-An ergodic morkov chain has the Probability that it is possible to pass form one state to another in a finite number of steps repardless of Resent state. A special type of esgadie markor chain is revolag markov Chain. the (ii) Regular markov chain :-A regular markov chain is defined as a Chain hould a transition materix p such that for some power of p it has only non-zero Positive Probability values. Thus all regular Chains must be ergodic Chains.

The easiest way to "Check if an engodie chain" is regulary" is to Grotinue squarry the toneition materix p until all the Zeros are removed. The toonsition Robability may or may not be independent & n. if it is independent of n, then the markov Chain is Said to be Homogeneous or to have stationary toonsition probabilities. If it is dependent on n, then the chain is Soud to be non- Homogeneous. A mankov chain,  $\xi \times n / n \ge 0$ ) with K states when K is finite, is said to be a finite moneon chain. The transition matoly in this case is a square matrix with K rows & Columns It the possible values of Xn are is said to be denumerably infinite. A stochastic motory is a readom motory !

With non-negative elements and unit sur Burns A stochastic matorix p is said to be degular if all the entoires of some proves pm are positive.

If '1' Occurs in the Principal diagonal.

Classification of States, Examples of Markow (10) Chain In Markov Frocess, the states are Clarified in Onder to find the Communicating Classes. The states of markov chain can be Partitioned into these Communicating classes Two states Communicate () it is Tossible to go from each to other ie: states A & B B Communicate (=) it is possible to go from A to B B to A 1) Transient a) Pesiodic 3) Engodic 1) Transient: A state is said to be toonsient if it is possible to leave state and never a) <u>Periodic</u>: - A state is said to be <u>Periodre</u> if it is not toonsient and that state is returned to only on multiples of some positive integer greater than 1' This integer is known as Peried . 2 the state.

(3) Ergodic: A state is said to be esgodie  
if if is netting torrestent non Periodic:  
1) The three state monkov chain is Given by  
the torresten Probability maters  

$$P = \begin{bmatrix} 0 & 2/3 & 1/3 \\ 1/2 & 0 & 1/2 \\ 1/2 & 1/2 & 0 \end{bmatrix}$$
  
Prove that the chain is Doublichle  
Sol: Biven that the three state of monkov chain  
is given by the torrester motorix  
 $P = \begin{bmatrix} 0 & 2/3 & 1/3 \\ 1/2 & 0 & 1/2 \\ 1/2 & 1/2 & 0 \end{bmatrix}$   
The Condition for Doublichle monkov chain is  
 $P = \begin{bmatrix} 0 & 2/3 & 1/3 \\ 1/2 & 0 & 1/2 \\ 1/2 & 1/2 & 0 \end{bmatrix}$   
The Condition for Doublichle monkov chain is  
 $P_1 = \begin{bmatrix} 0 & 2/3 & 1/3 \\ 1/2 & 0 & 1/2 \\ 1/2 & 1/2 & 0 \end{bmatrix}$   
Then it can be said that a state can be verified  
form every others state:  
 $P = 0 \begin{bmatrix} 0 & 2/3 & 1/3 \\ 0 & 2/3 & 1/3 \\ 1/2 & 0 & 1/2 \end{bmatrix}$   
 $P' = \begin{bmatrix} 0.5 & 0.1666 & 0.3333 \\ 0.25 & 0.5833 & 0.1666 \\ 0.25 & 0.3333 & 0.41666 \end{bmatrix}$ 

6

$$P^{3} = \begin{bmatrix} 0.25 & 0.5 & 0.27 \\ 0.375 & 0.27 & 0.375 \\ 0.375 & 0.375 & 0.25 \end{bmatrix}$$

$$for p^{5} \otimes P^{3}, P_{1j} > 0$$

Markov Analysis 1 - Markov Frocers is devived from Russian Mathematician Andrei Markov (1856 - 1922) -) This type of probabilistic models known as Stochastic Process; in which the Current state of a fracers depends on all of its Frevious state. -> Uses . To examine and Fredict the behaviored 3 Concerners in terms 3 their brond loyality and switching Patterns to Other branchest. brands. --- Usually Constanted in terms of tarreition -> Used to study the Stock market Price Possibilities movements.

Stochastic Frocess. A stochastic Frocess is a family 2) Mandom Variables { XB : BEA} where TZ is the index Parameter assumes Values in a Certain glonge A A - Index set - Indrei Markov (1856-1922) Markov is Particularly remembered for hig study of Markon Chains Sequences of standom voriables in which tre foture Variable is determined by the Present Variable but is independent of the way in which the Present state arose from its redecessors This work Launched the theory of Stochastic Process.

i) What is a Markov Chain? A) A markov Chain is a Mathematical Fracers that toonsitions from one state to another within a finite number of possible States. It is a Collection of different states and Robabilities of a vorsiable. where its future Condition (or) state is Substantially dependent on its immediate Revious State . 2) What do you mean by Markov Chain? A) A Markov Chain (or) Markov Process is a stochastic model describing a sequence of possible events in which the Probability of each event depends only on the state attained in the frevious event. 0.3

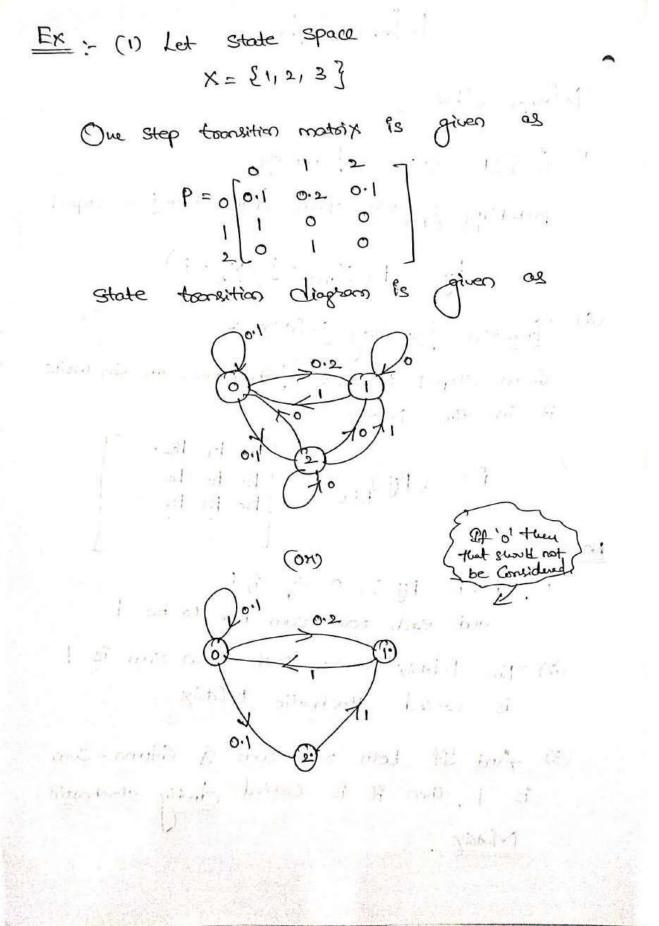

3) what is the First Order Markov Chain A) The Markov Chain of the First Order is One for which each subsequent state depands Only on the immediately freceding one. Markov Chains of second (or) highly Ordere are the Processes in which the next state depends on two or more freceding Ones. (A) How do Markov Chains work? A) A Markov Chain is a Matternatical system that experiences transitions from one state to another according to Certain Probabilistic sucles. The definity Characteristic of a Markov Chain is that no matter how the focus around at its forsent state, the possible future states are fixed. A 0.2 0.317 20 000 13 0.5 B 0.7 0.1 N: 31. 15 the straight

(5) What are Markov Rocesses Used for? A) They are stochastic Processes for which the description of the Present state folly Captures all the information that Could influence the future evolution of the Process. Redictly toatfie flows, Communications netwooks, Genetic issues and green guernes are examples where more chain on be used to model Review more '

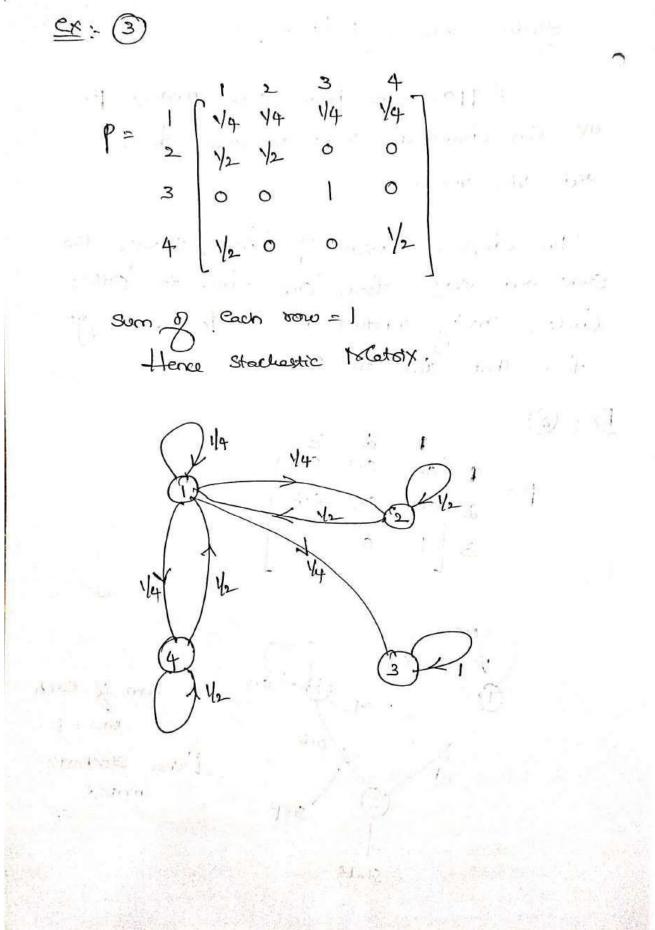

Markov Chain  
Markov Chain  
(1) I - step Tranktion Potenbilty  
Probability & going from stade i to j in step-1  

$$F_{ij} = P(X_{n+1} = j/X_n = i)$$
  
(a) Transition Probability Matrix :  
Given step-1 transition Probabilities, we can write  
 $H$  in the Matrix form as  
 $P = (P_{ij})_{i,j} \in S = \begin{bmatrix} Ro & Bi & Ra - - - - \\ Ro & Bi & Ra - - - \\ Ro & Ro & Ro & Son & Son & Son \\ Ro & Son & Son & Son & Son \\ S & And & Bi & both & row - Son & & \\ S & And & Bi & both & row - Son & & \\ S & I, then & H & Is & Called & Column - Son \\ Is & I, then & H & Is & Called & Column - Son \\ Is & I, then & H & Is & Called & Column - \\ Modoly & . \\ \end{array}$ 

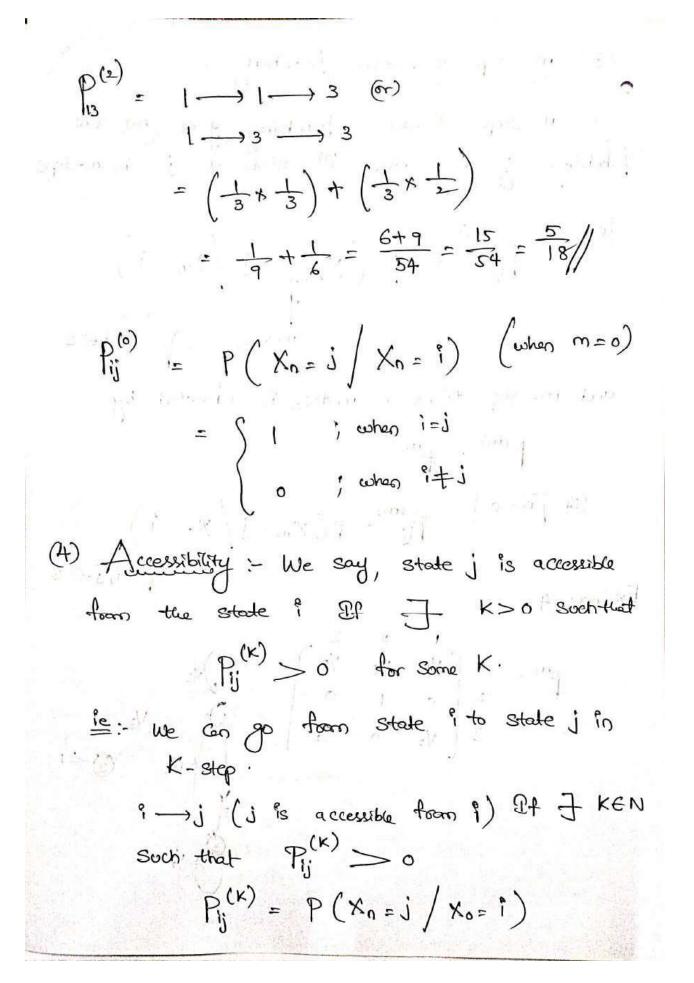

State Tronsition Matrix:  
Suppose we have given' matrix 
$$P$$
.  
We can drow a state tarnettion diagram  
and Vice-verssa  
The diagram Consists of Circle, Strongly the  
State and edge form one Circle to Other  
Circle, shaving whether it is possible to go  
form that state to Other.  
 $EX: O$   
 $P = \int_{a}^{a} \begin{cases} 0.77 & 0.3 & 0 \\ 0.1 & 0.3 & 0.6 \\ 1 & 0 & 0.1 \end{cases}$   
 $P = \int_{a}^{a} \begin{cases} 0.77 & 0.3 & 0 \\ 0.1 & 0.3 & 0.6 \\ 1 & 0 & 0.1 \end{cases}$   
 $\int_{a}^{a} \int_{a}^{b} \int_{a}^{b$

(a) Parithin is either sad (s) or happy (H) each day If he is happy in One day, he is sad on the next day by four times out of five. If he is sad on one day, he is happy on the next day by two times out of twee over a long run, what are the chances that Parithi is happy on any and the on any given day? ee. . 711. i Dol: The Transition Probability matoly is T= (4 - 5) At equilibrium  $(S, H)\left(\frac{4}{5}, \frac{1}{5}\right) = (S, H)$  $\left(\frac{2}{3}, \frac{1}{3}\right)$  where S+H=1453+ 2= H = S 4s+ 2= (1-s)= S On solving this, we get  $S = \frac{10}{13} \implies H = \frac{3}{13}.$ the long swn, on a signdomly selected day his choices of being happy is 10/13

(3) Alash bads according to the following toxits  
Ef he makes a hit (s), there is a 25%. Chonce  
that he will make a hit his next time at bat  
Ef he foils to hit (F) there is a 35%. Chonce  
that he will make a hit his next time at bat.  
I find the toxisition probability materix for  
the data and determine Akashi long-range  
batting outrage.  
Sol = -The Transition Probability materix is  

$$T = (0.25 \ 0.35 \ 0.65)$$
  
At equilibrium (s F)  $(0.25 \ 0.45)$  = (s F)  
where  $3+F=1$   
 $0.25S + 0.35F = S$   
 $0.25S + 0.3$ 

(4) 80%. I students who do mathe work during One study period, will do the mathe work at the next study period. 30% of students who do english work during One study period, will do the english work at the next study period. Initially ture were 60 students do mathe and 40 students do english work Calwate, (i) The Transition Frobability matrix (ii) The number of students who do mathe work english work for the next subsequent a study periods. Dol: ME ME  $\begin{pmatrix} 60 & 40 \end{pmatrix} = E \begin{pmatrix} 0.8 & 0.2 \\ 0.7 & 0.3 \end{pmatrix}^{2}$ . ME M (60 40) M(0.78 0.22) E(0.77 0.23)= (46.8+30.8 13.2+9.2) 10.00 = (77.6 22.4)m

Dol: Transitua Probabilisty materx  $T = M \begin{pmatrix} M \\ 0.8 \\ 0.7 \\ 0.3 \end{pmatrix}$ After One study Posiod  $\begin{array}{cccc} M & E & M & E & M & E \\ M & \begin{pmatrix} 0.8 & 0.2 \\ 0.7 & 0.3 \end{pmatrix} = \begin{pmatrix} 76 & 24 \end{pmatrix} \\ \hline \end{array}$ So in the very next study period, there will be 76 students do maths work and 24 students do the English work -After two study periods  $M E M \begin{pmatrix} 0.8 & 0.2 \\ 0.7 & 0.8 \end{pmatrix} = (60.8 + 16.8 \\ 15.2 + 7.2 \end{pmatrix}$ = (77.6 22.4) 1 14 After two study Periods there will be 78 (Approx) students do matty work and 22 (Approx) students do English work. 化品质 医内静脉

Stochastic Process: Stochastic Process is a set of Kandom Variables Aparding depending on some great Parameter like time t ( based on time t) Markov Forcess: (or) Markov Chain :-A grandom Process in which the occurrence of future state depende on the immediately Reading. Freceding state and Only on it is known as the Markov Process (or) Markov Chain Uses: (1) Behaviour of Consumers in terms of their brend loyality and switting Pattern . (2) Machine uses and monufacture a Product. ( two states working or not working only point) (3) State is a Condition (or) Lacetian of an Object in the system at Particulary time. Assumption - 1) Finite no of state. 2) State are metually exclusive (working Not working) 3) State are Collectively exclusive (possible stary 4) Probability of moving from one state to other state is Constant over time.

Laure 2 and )ptimization ( ) nit-5 Optimization :- Optimization Problem requires us to maximum and Minimum value of a function. determine There are Two types of Optimization (1) Constrained Optimization (2) Un Constoained Optimization (1) Un Constrained Optimization :-There are two types of Roblems They are (1) Profit makimization (2) Cost minimization Fractical Computational task of finding maxima (Or) minima of a function of many variables Method :-Step (1) Find the desirative of a function with respect to x and y then put it equals to Zero to find the values of x and y Paints which is points. Called as stationary  $\frac{dt}{du} = 0 \longrightarrow (1)$  $\frac{dt}{dt} = 0 \longrightarrow \textcircled{}$ By solving (1) & (1) we have Paints (x1 y) stationary points. ->

1.11

(1) Find the Extreme value 
$$g$$
  
 $f(x) = x^3 + y^3 - 6xy$  and determine  
whethes they are preserves (or) Minimum.  
Sel: given  $f(x) = x^3 + y^3 - 6xy$   
 $\frac{\partial f}{\partial x} = 3x'' + 0 - 6y = 0$   
 $= 3(x'' - 2y) = 0$   
 $y'' - 2y = 0$   
 $y'' - 2y = 0$   
 $= 3(y'' - 2x) = 0$   
 $= y'' - 2x = 0$   
 $g'' - 2x = 0$   
 $(y'' - 2x = 0)$   
 $(y'' - 2x = 0)$   
 $\frac{x^4}{4} - 2x = 0$   
 $= x^4 - 8x = 0$ 

Page 5 of 64

0

$x^4 - 8x = 0$
$x(x^3-8)=0$
$x=0$ $x^{3}-8=0$
$\chi_{\mathcal{B}} = \mathcal{B}$
$\chi = 3\sqrt{8} = a^3$
$x = 2$ $x^3 = 2^3$
Putter of in (1)
Potting x in (1)
$y = \frac{x^{m}}{2}$
when $[x=0] = \frac{1}{2} = \frac{1}{2} = 0$
when $X=2 \implies y = \frac{2^{n}}{2} = \frac{4}{2} = \frac{9}{2}$
- Stationary Points are (0,0) (2,2)
Second Ordeg. Condition :-
$\frac{\partial f}{\partial x} = 3x^{n} - 6y \qquad \frac{\partial f}{\partial y} = 3y^{n} - 6x$
$A = \frac{\partial^2 f}{\partial x^2} = 6x$
$B = \frac{\partial^2 f}{\partial x \partial y} = -6$
Drog
$C = \frac{\partial^{n} f}{\partial y^{n}} = 6y$

A = 6t , B = -6, C = 6y (3)  
a) At print (9,0):  
A = 6(0) = 0 
$$\Rightarrow$$
 [A=0]  
B = -6  $\Rightarrow$  [B=-6]  
C = 6(0) = 0  $\Rightarrow$  (C = 0  
AC-B<sup>N</sup>  
 $\Rightarrow$  (0)(0) - (-6)<sup>N</sup> = -(36) = -36 < 0  
 $\therefore$  No Extreme fort  
b) At print (2,12):  
A = 6(2) = 12  $\Rightarrow$  [A=12]  
B = -6  $\Rightarrow$  [B=-6]  
C = 6(2) = 12  $\Rightarrow$  [A=12]  
B = -6  $\Rightarrow$  [B=-6]  
C = 6(2) = 12  $\Rightarrow$  [A=12]  
AC-B<sup>N</sup>  
 $\Rightarrow$  (12)(12) - (-6)<sup>N</sup> = 144 - 36 = 108  $\Rightarrow$ 0  
 $\text{Stateme Point}$ .  
A = 12  $\Rightarrow$ 0, Postore Point.  
A = 12  $\Rightarrow$ 0, Postore Point.  
Extreme value at  $f(2,12)$   
 $f(x,y) = x^3 + y^3 - 6xy$   
 $= 3^3 + 2^3 - 6(2)(2)$   
 $= 8 + 8 - 6(4) = 16 - 24 = -8$   
So, -8 is priminum value at  $x = 2$  (2)  $4 = 3$ 

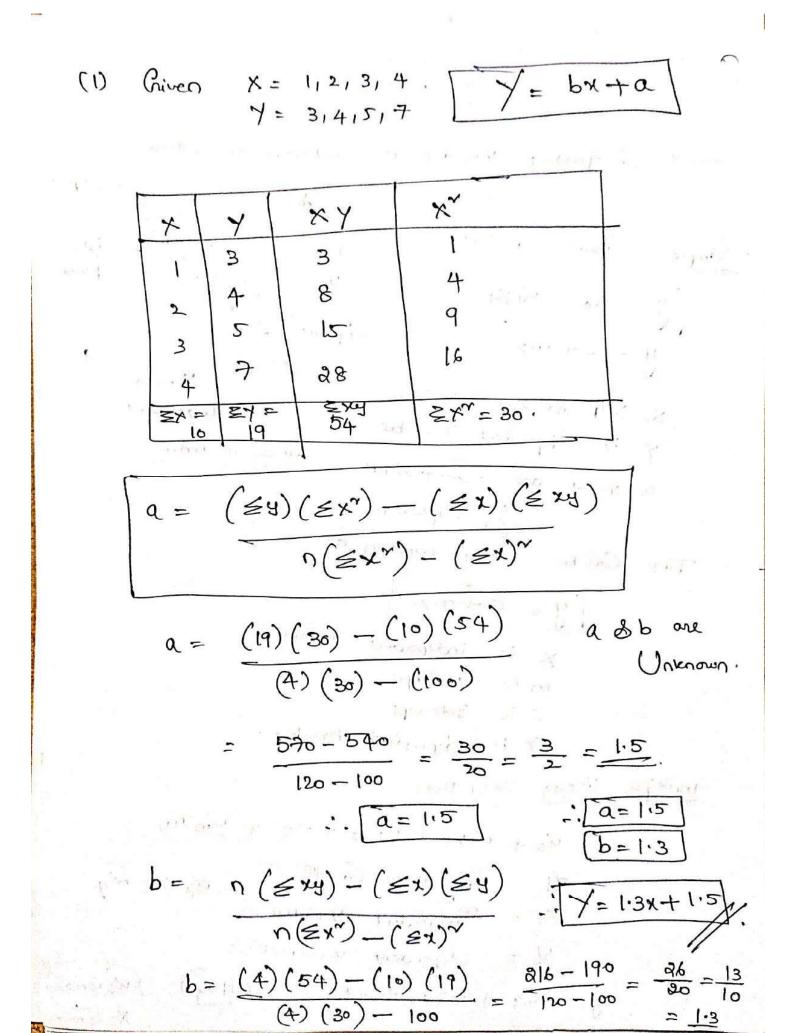

Page 8 of 64

Cenonical form . Att optimization Problems Can be worther as Minimize -f(x) subject to Constrount that XES feasible Points  $S = \left\{ \frac{x}{+}, \frac{g^{(1)}(x)}{+}, g^{(1)}(x) = 0 \text{ and } \frac{1}{+}, \frac{g^{(1)}(x)}{+} \leq 0 \right\}$   $\int \int \int \frac{1}{+} \int \frac{1}$ tom epn () equality Constraint q(x) = x1+x1+x3-1=0 tom egn D Inequality Constraints Can be worthin as  $h(x) = x_1 + x_2 + x_3 - 1 < 0$ feasibility set is a Combination of equality Constraint & Trequality Constraints.

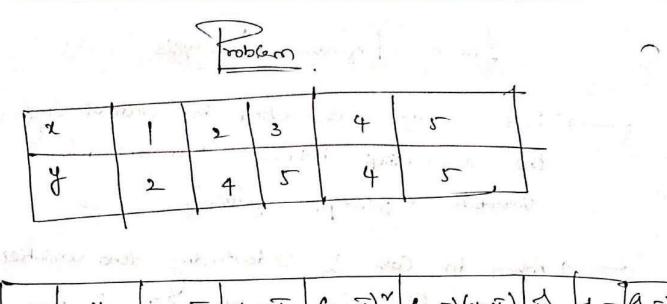

Creneralized Lagrange function. -) The Constrained Optimization Froblem requires us to minimize the function while ensuring that the point discovered belongs to the feasible set -) The are Several techniques that achieve this but it is, in general, a defficult Problem. -) A very Common approvach is to define a new function called the generalized Lappangian.  $L(x_1,\lambda,\alpha) = f(x) + \underset{i}{\overset{\vee}{\underset{\lambda_1 \alpha}} \lambda_i g'(x) + \underset{j}{\overset{\vee}{\underset{\lambda_1 \alpha}} \lambda_i g'(x) + \underset{j}{\overset{\iota}{\underset{\lambda_1 \alpha}} \lambda_i g'(x) + \underset{j}{\underset{\lambda_1 \alpha}} \lambda_i g'(x) + \underset{j}{\underset{\lambda_$ Lagrangian. Oroiginal -) Then the Constoomed minimum is given by function  $\frac{m}{xes} f(x) = \frac{m}{x} \frac{m}{\lambda} \frac{m}{x} \frac{m}{x} \sum_{i} \frac{\lambda_{i} x_{i}}{\lambda_{i} x}$ we will the Proof and details of this when we come to bethe weeks.

) n:t-5 ---- In this Chapter we shall Concern Our schues with the Classical theory of Optimization. differential Calculus to determine the Prink of Maxima & Minima for both Unconstrained and Constrained Continuous functions. ---- The this Chapter the topics include the development of necessary and sufficient Conditions too locating extreme painte for Unconstrained Toblems The toestement of the Constrained Froblems Using the Lagrangian methods and the development of the Kuhn- Tuckeer Conditions for the general Froblem with inequality Constraints.

Page 21 of 64

-f(x) Point of inflection Max Consider a Continious Max Max function -f(x) defined Nin on in interval (a,b) 0 a x1 x2 x3 x4 x5 x6 b. X Here the points x1 x2, x3, x4 & x6 (not x5) represent all the Joins of Maxima & Minima. (called the stationary (or) Critical points ) & fix) These includes x1, x3, & x6 as Points of Maxima of x2 & x4 as points of Minima. Chlobal (absdure) Maximum : since f(x6) = max & f(x1), f(x3), f(x6)g, f(x6) is Called a global (or) absolute maximum Locaf (relative) maxima :-On the Other hard f(x1) & f(x3) are called local (or) relative maxima ( 1 mg f(x4) is a local Minimum while, ( f(x2) is a global minimum. It should be noted that the point A Coursespording to f(x5) is Called First of Inflection

Page 23 of 64

Necessary & Sufficient Conditions for Optima. Necessary Condition :- . while to be much - necessary Condition for a Continious -function f(x) with Continious first and second Fartial destructives to have an extreme point at Xo is that each first Partial desirative of f(x) evoluate at Xo, Vanish that Bg  $\nabla f(x_0) = 0$ where  $\nabla \equiv \left(\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \frac{\partial f}{\partial x_8}, \frac{\partial f}{\partial x_n}\right)$  is the gradient vector the states of any Sufficient Condition . A sufficient Condition for a stationary Point 'xo' to be an 'extreme Point is that the Hession matrix It evaluated at 'xo' is (1) Negative - definite when 'to Ba Maximum Point & (2) Positive - definite when it's a Minimum Point. participances A transformed topological dependence and identical all in the is the second of the second of

Page 24 of 64

roof for Conditions : 1) Foot for necessary Condition :-By Taylors theorem, for 0 < 0 < 1  $f(x_0+h) - f(x_0) = \nabla f(x_0)h + \frac{1}{2}h' Hh |_{x_0+eh}$  $h = (h_1 h_2 \cdots h_j \cdots h_n)^{\prime} \otimes$ where [hj] is small enough - y j=1,2--... for small [hi] the sumainder term 1 (h'th) is of Order him of hence it will tend to Zero as hi -> 0 - Fry Edge and  $f(x_0+h)-f(x_0)=\nabla f(x_0)h+O(hi^2)$ -)(2)  $\nabla f(x_0)h \equiv \left[h_1 \frac{\partial f(x)}{\partial x_1} + h_2 \frac{\partial f(x)}{\partial x_2} + \dots + h_p \frac{\partial f(x)}{\partial x_p} + \dots + h_n \frac{\partial f(x)}{\partial x_n}\right]$ X=XO Suppose that to is an extreme point, now we shall Fore the theorem by Contradiction, have If possible, Let us suppose that one of the partial desivatives, say pth, does not Vanish,  $\frac{10}{2}$ :  $\frac{0}{10}$   $\frac{1}{10}$   $\frac{1}{10}$   $\frac{1}{10}$   $\frac{1}{10}$ 0 20 egn () becomes -f(xo+h) - f(xo) = hp ()xo and and here a

Page 25 of 64

Since 
$$\frac{\partial f(x_0)}{\partial x_p} \neq 0$$
, eithing  
 $\frac{\partial f(x_0)}{\partial x_p} \geq 0$  (or)  $\frac{\partial f(x_0)}{\partial x_p} \geq 0$   
Now suppose  $\frac{\partial f(x_0)}{\partial x_p} \geq 0$  then  $f(x_0+t_0) - f(x_0)$   
will have the same sign as hp  
 $\underline{E}$ : (b)  $f(x_0+t_0) - f(x_0) \geq 0$  when  $hp \geq 0$   $\Phi$   
(ii)  $f(x_0+t_0) - f(x_0) \leq 0$  when  $hp \geq 0$   $\Phi$   
(iii)  $f(x_0+t_0) - f(x_0) \leq 0$  when  $hp \geq 0$ .  
This Contradicts the assumption that 'x\_0' is an  
extreme point  
The augument earlier  $\frac{\partial f(x_0)}{\partial x_p} \geq 0$  is similar to the  
given above.  
Thus we may Conclude that when any g the  
Partial desirutives are not identically equal to Zero  
of 'x\_0', the Part 'x\_0' is not on extreme Part  
Thus, it follows that for 'x\_0' to be an extreme  
Part it is necessary that  
 $\frac{(\sqrt{f(x_0)} = 0}{\sqrt{f(x_0)} = 0}$ .  
This Complete the Part g the theorem.

Page 26 of 64

(a) Poot for Sufficient Endition:  
Proof: By Toylon's theorem for 02021  
we have  

$$f(x_0+h) - f(x_0) = \nabla f(x_0)h + \int h + h h | x_0+eh}$$
  
Since 'x\_0' is a stationary Pont, then by Preading  
theorem (necessary Condition theorem) we have  
 $\boxed{\nabla f(x_0) = 0}$   
Thus  $f(x_0+h) - f(x_0) = \int h + h h | x_0+eh}$   
let xo be a Maximum Pond than by Clefavitian  
 $f(x_0+h) \leq f(x_0)$   
for all non-null h.  
This implies that for xo be to be a Maximum.  
 $\frac{1}{2h} + \frac{1}{2h} + h h | x_0+eh}$   
we have  
 $\lim_{x_0 \to 0} \lim_{x_0 \to 0}$ 

Page 27 of 64

However, since the second Partiel derivative Orf(x) is Continious in the neighbourhood of to Dr: Drj 415-1 111 Dridry 1 = x0 Dridry 1 = x0  $\left| \frac{\partial^{n} f(x)}{\partial x i \partial x j} \right|_{x = x0 + 0h}$ Consequently hitth most yield the same sign when evaluated at both to & xo+Oh. Thus toon can () we have minuted hitth with of the second of the second of the x=xo) (intai) : Since h'the defines a quadratic form, this N=XD expression (and hence h'the) is negative <=> the Herrian materix II is negative-definite at the This Completes the Front for maximization Gase. similer Froof Con be established for minimization Case to show the Converpenday Hersian materix H is <u>Positive</u> definite at Xo

(1) Find the Maximum 
$$(B (Cr) Minimum B the
function
 $f(x) = x_1^n + x_2^n + x_3^n - 4x_1 - 8x_2 - 12x_3 + 56$   
 $Sol : Applying the recessory Grittion
 $\nabla f(x_0) = 0$  (or)  
 $\left(\frac{\partial}{\partial x_1} + \frac{\partial}{\partial x_2} + \frac{\partial}{\partial x_3}\right) + f(x) = (0, 0, 0)$   
this gives  $\frac{\partial f}{\partial x_1} = \frac{\partial}{\partial x_2} + \frac{\partial}{\partial x_3} + f(x) = (0, 0, 0)$   
this gives  $\frac{\partial f}{\partial x_1} = \frac{\partial}{\partial x_2} - \frac{\partial}{\partial x_3} + \frac{\partial}{\partial$$$$

-onstoained Optimization : The general Constrained Optimization task is to maximize (00) Minimize a function -f(x) by Varsyling X given Certain Constant on X. find minimum  $\beta + (x_1, x_2, x_3) = x_1^{n} + 2x_2^{n} + x_3^{n}$ where  $||x||_{2} \geq 1$ - Very Comman to encounter this in engineering Proctice . 22.81.43 a Constant on fuel efficiency. -> All Constability Can be Converted to two types of Constants pass de 2 2) Trequality Constoaints 241110 1) Equality Constraints Ex: Minimize f(x1, x2, x3) Subject to  $x_1 + x_2 + x_3 = 1 \implies x_1 + x_2 + x_3 = 0$  $\Rightarrow g(x) = x_1 + x_2 + x_3 - 1 = 0.$ 2) Inequality Constants: polinimize - (x1, x2, x3) Subject to  $x_1 + x_2 + x_3 < 1 \implies h(x) = x_1 + x_2 + x_3 - 1$ 

Cronical form :-  
All optimization Problems (on be written as  

$$S = \{ x \mid \forall i, g^{(i)}(x) = 0 \ \forall j h^{(j)}(x) < 0 \}$$
  
minimize f(x) subject to the Constrainty that xCS  
is the feasible Birt.  
Generalized Lagrange function :-  
The Constrained Optimization Problem sequence that  
the point discovered belongs to the feasible state  
the point discovered belongs to the feasible state  
the point discovered belongs to the feasible state  
but it is in general, a difficult problem  
 $L(x, \lambda, x) = f(x) + \neq \lambda; g'(x) + \notin g; h^{(j)}(x)$   
extense  
 $L(x, \lambda, x) = f(x) + \neq \lambda; g'(x) + \notin g; h^{(j)}(x)$   
 $f(x) = given function :-
 $f(x) = given function :-$   
 $f(x) = given function :-
 $f(x) = given function :-$   
 $f(x) = given function :-
 $f(x) = min max max L(x_i, \lambda, x)$$$$ 

KKT Conditions / necessary and sufficient Condition for Optima :-In Mathematical Optimization, the Kanuch -Kuhn-Tucker (KKT) Conditions, also known as the Kum-Tuckey Conditions, are first derivative tests (sometimes called First Order recessary Conditions) for a solution in non-linear Programming to be Optimal, Rovided that some regularity Conditions Satisfied. ane The Necessary and Sufficient Conditions for solving the Non-Linear Programming Froblem with Inequality Constants 1111 - We know that when Non-Linear Programmy forbam with equality Constoaints Maximize / Minimize +(x) such that f:(x) = bi =) we can solve the Froblam with Lagrangian muttiplies method: - Now, Consider the Non-Lincon Programmy Fraken with Inequality Constants Maximze / Minimze f(x) such that  $f(x) \leq bi$ (or)  $d(x) \equiv p_1$ 

=) We can solve the Problem with KKT Method. son 1 in the \_onditions : Maximization Problem: Consider the NLPP maximize fix) such that  $g_i(x) \leq b_i$ Convert each ith inequality Constraints into equations by adding the non-negative slack variables is Site particulation that have proved the provent (1) = x1+x2+S1=  $g_{i}(x) + s_{i}^{\vee} = b_{i}$ Consider  $h_i(x) = g_i(x) + s_i^{n} - b_i = 0 \longrightarrow (1)$ Thus given NLPP reduces to maximize fix) such that hi(x) = 0 . Now equality Constant so we can use 11 - (w) + Lagrongion method. tormulate the Lagrangian function as  $L(x_i, s, \lambda) = f(x) - \neq h \lambda; h: (x)$ (Addat) - Attack - and  $= f(x) - \neq \lambda_i \left(g_i(x) + S_i^n - b_i\right)$ (: form ()) id 🚔 (x) ij tattirai (x) r 🖓 🖧

The necessary Conditions for stationary Points are  $\frac{\partial L}{\partial x} = 0 \implies \frac{\partial f}{\partial x} - \frac{1}{2}\lambda_i \frac{\partial g_i}{\partial x} = 0 \longrightarrow (2)$ and see in the base for particular  $\frac{\partial L}{\partial \lambda_{i}} = 0 \implies g_{i}(x) + S_{i}^{v} - b_{i} = 0 \longrightarrow 3$  $\frac{\partial L}{\partial s_i} = 0 \implies -2\lambda_i S_i = 0 \implies 4$ solve 23 3 & 4) we get stationary fints multiply equations (A) by Si & get in all i have on NSi"=10 is but is pointed  $\Rightarrow \lambda i (bi - g_i(x)) = 0$  $\frac{\lambda_{i=0}}{b_{i}} (ar) = b_{i} - g_{i}(x) = 0$ Is measures the state of variance of f Sina worto bi ie: Of = XI term equation (4) we have either [] i=0 (or) both Varish at Optimal Conditions. Si = 0

<u>ase-1</u>: when Si == 0 It means Constraint is Satisfied as stold Inequality (: Si >i = 0) It we relaxed the Constraint (make bi Larger) the stationary point will not be affected  $\therefore [\lambda_i = 0]$ <u>ase-2</u>: when  $\lambda_i \neq 0$ . This implies si=0 Te: Constant Society as equality. initi promoti ie: ogi (x) = bi (s) (s) ontos Let Xi 20 = Of Zo piphin This implies that as bi is increased, the Objective However as bi increases more space become function decreases (10) having feasible and the Optimal value of the Objective function f(x), Clearly Connot decrease. Hence an Optimal Solution  $\underline{ie}$ :  $\lambda_i \ge 0$  .  $\omega$ (lay for Case of minimization as be increased f(x) Connot increase which implies that Ni Co

Page 45 of 64

Pernonks:  
If the Constraints are equations  

$$\underbrace{fe}:=g_{i}(x) = bi$$
then  $\lambda_{i}$  becomes Unvertoided in Sign.  
Conclusion:  
Hence for Non-Linean Propromity Problem  
Maximize  $f(x)$   
Such that  $g_{i}(x) \leq bi$   
The necessary Conditions  
 $\underbrace{Off}_{i} = \frac{1}{2}(x) \leq bi$   
 $i \quad Off = 0$   
 $\lambda_{i} (g_{i}(x) - b_{i}) = 0$   
 $i \quad g_{i}(x) \leq bi$   
 $\lambda_{i} \geq 0$ 

(1) Dolue the NLPP Maximize Z= 3.6×1-0.4×1×+1.6×2-0.2×2 such that  $2x_1 + x_2 \leq 10$ X1, X2 20 Dol. For the KKT Conditions to be necessary and sufficient for Z to a maximum f(x)should be Concave and  $q(x) \leq 0$  is Convex. for f(x) = 3.6x1 - 0.4x1x4 1.6x2 - 0.2x2 to be Grave we Constant the Herrian materix as  $H = \begin{bmatrix} \frac{\partial^{4}f}{\partial x_{1}} & \frac{\partial^{4}f}{\partial x_{1}\partial^{2}2} \\ \frac{\partial^{7}f}{\partial x_{1}} & \frac{\partial^{7}f}{\partial x_{1}} \end{bmatrix} = \begin{bmatrix} -0.8 & 0 \\ 0 & -0.4 \end{bmatrix}$ The Principale minors DI= -0:8 <0  $D_{2=} \begin{bmatrix} -0.8 & 0 \\ 0 & -0.4 \end{bmatrix} = \frac{0.32}{0}$ Thus Di <0, D2>0 ie: Opposite sign with < & hence it is Concave Also the Constraint dx1+x2 < 10 is Lincon from and we know every linear function is Convex Hance the KKT Conditions are sufficient Conditions for the maximum.

Define the Lagrangian function as  $L = f(x) - \lambda g(x)$ = (3.6x1-0.4x1"+1.6x2-0.2x2") - X (2x1+x2-10) The necessary Conditions are  $\frac{\partial L}{\partial x} = 0$ ,  $\lambda g = 0$ ,  $\lambda \ge 0$ ,  $g \le 0$ ,  $x \ge 0$  $\frac{\partial L}{\partial x_1} = 0 \implies 3.6 - 0.8x_1 - 2 = 0 - 0.000$  $\frac{\partial L}{\partial x_2} = 0 \implies 1.6 - 0.4 x_2 - \lambda = 0 \longrightarrow 0$  $\lambda g = 0 \implies \lambda (2x_1 + x_2 - 10) = 0 \xrightarrow{(1)}$  $\lambda \ge 0 \implies \lambda \ge 0$  $q \leq 0 \implies q_{x_1} + x_2 \leq 10$  $x \equiv 0 \implies x_{1,1}x_{2} \equiv 0 = \frac{x_{0,1}}{x_{0,1}}$ (6) we have the following Cases. -11-Case-1: When TA=0 form (18) we have x1=4.5, x2=4 which does not satisfy egn (3) \$ hence this Case is discarded. Same I consist work proved and and the mostilities from the set where are all math 144 und manie 1-182-11145-519

Page 48 of 64

• Content is when 
$$\overline{\lambda \pm 0}$$
  
from (3) we get  
 $\exists x_1 + x_2 = 10$   
form (1) & (2)  $\dot{x}_1 = \frac{3(6-2\lambda)}{0.8}$   $\dot{x}_2 = \frac{1(6-\lambda)}{0.4}$   
 $\therefore \exists \left(\frac{3(6-2\lambda)}{0.8}\right) + \left(\frac{1(6-\lambda)}{0.4}\right) = 10$   
 $[\lambda = 0.4]$   $(\therefore \lambda \equiv 0)$   
Hence  $x_1 = 3.5$ ,  $x_2 = 3$   $(\therefore x_1, x_2, \text{ Sub Valuey})$   
in (5) solvering  
 $\exists 0 \text{ Golve the following NLPP}$   
Minimage  $Z = -10g x_1 - 10g x_2$   
 $\exists \text{ Such that } x_1 + x_2 \leq 2$   
 $\exists x_1, x_2, z \equiv 0$   
 $\exists 0 \text{ Golve the KKT Gorditical to be for Z to be reactions in the formula for  $f(x)$  should be Genvex, we Gorditorat the Hamily matrix as  
 $H = \begin{bmatrix} 1/4\pi^{\circ} & 0 \\ 0 & 1/4\pi^{\circ} \end{bmatrix}$   $\therefore H = \begin{bmatrix} 3\pi^{\circ} & 3\pi^{\circ} \\ 3\pi^{\circ} & 3\pi^{\circ} \\ 3\pi^{\circ} & 3\pi^{\circ} \end{bmatrix}$$ 

Page 49 of 64

Minors are  $D_1 = \frac{1}{x_1 x} > 0$  $D_{2} = \begin{vmatrix} 1 \\ x_{1}^{m} \\ 0 \end{vmatrix} = \frac{1}{x_{1}^{m} x_{2}^{m}} \ge 0$ Also the Constraint x1+x2 <2 is Linear tinding and hence . it is Convex also Thus KKT Conditions will be minimum Define a Lagrangian function as  $L = (-\log x_1 - \log x_2) - > (x_1 + x_2 - 2)$ The necessary Conditions are  $\frac{\partial L}{\partial x_{l}} = 0 \implies \frac{-1}{x_{L}} - \lambda = 0 \implies \textcircled{1}$  $\frac{\partial L}{\partial x_2} = 0 \implies -\frac{1}{x_2} \xrightarrow{\lambda=0} \longrightarrow \textcircled{3}$   $\frac{\partial L}{\partial x_2} = 0 \implies \chi_2$   $\lambda g = 0 \implies \lambda (x_1 + x_2 - 2) = 0 \longrightarrow \textcircled{3}$  $\lambda \leq 0 \implies \chi \leq 0 \longrightarrow (4)$  $g \leq 0 \implies \chi_{1+}\chi_2 \leq 2 \longrightarrow B$  $x \ge 0' \Longrightarrow x_{11}x_{2} \ge 0 \longrightarrow 6$ ve have the following Cans.

Case-1: N=0 form (DS) we have  $\chi_1 = \infty$ ,  $\chi_2 = \infty$ which violate egn (5) and hence this care is that we while the discarded . Case-2: When [] = 0] from eqn (3) , x1+x2= 2 form (D&D) ve get  $X_{l} = -\frac{1}{\lambda}, \quad X_{2} = -\frac{1}{\lambda}$ · FA=-1 195 96 -trustley we have X1=1, X2=1 which sotisfy all the necessary Conditions Hence the stationary point is  $(x_1, x_2, \lambda) = (\overline{v_1, -1})$ is the Optimal solution and value is 1 de Z= -logi-logiano will ación Z=0 Company Marine 

(3) Solve the following NLPP  
Maximize 
$$Z = 8x_1 + 10x_2 - x_1^{N} - x_2^{N}$$
  
Such that  $3x_1 + 2x_2 \leq 6$   
 $x_1, x_2 \equiv 0$   
Set: For the KRT Conditions to be NC 8 se  
for  $Z$  to be Maximum  
 $f(x)$  Should be Concome B  
 $x(x) \leq 0$  is Convex.  
for  $f(x)$  to be Concome we Construct the  
Hausen Matrix  
 $H = \begin{bmatrix} Stf} & OF \\ Stind 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 \\ 0 & -2 \end{bmatrix}$   
 $Pt$  minors are  $D_1 = -2 \leq 0$   
 $D_2 = \begin{bmatrix} -2 & 0 \\ 0 & -2 \end{bmatrix} = 4$ .  
which is Opposite Sign stoorty with  $\leq 0$   
Thus if is Concome.  
Also the Constroant  $Bt_1 + 2x_2 \leq 6$  is a  
Linear Encement is Convex.

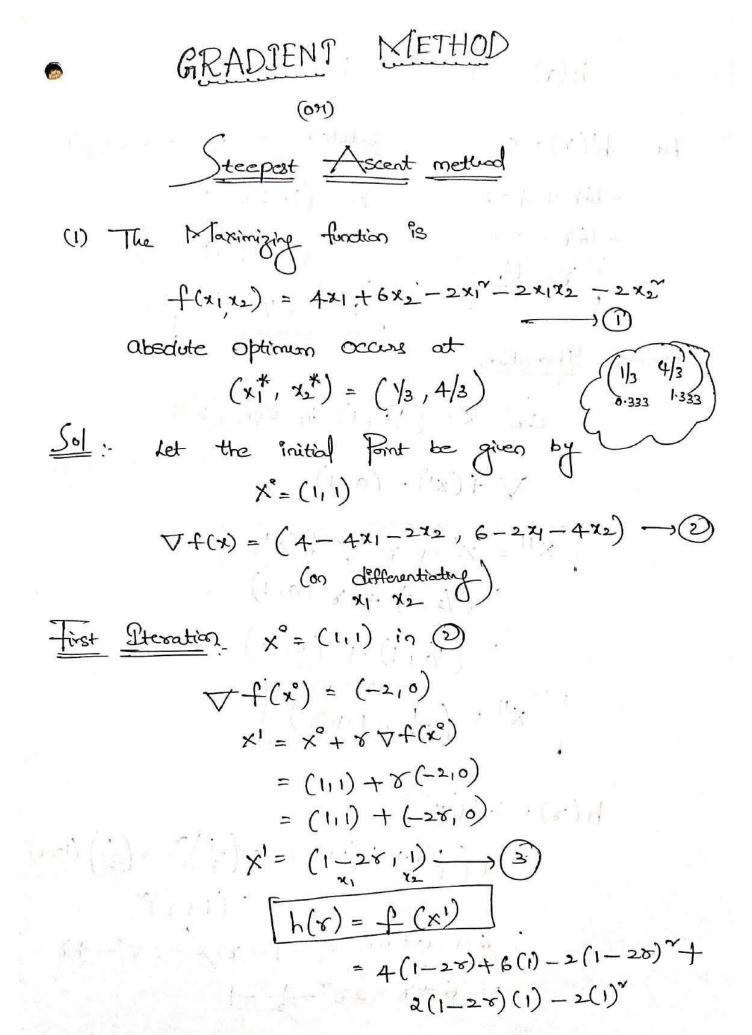

Thus the KKT Conditions will be Necessary Sufficient for a Winimum Define a Lagrangian function as L= (8x1+10x2-x1-x2) -> (3x1+2x2-6) The necessary Conditions are QL =0, Ag=0, AZO, GZO, XZO. The necessary Conditions are 8-2×1-92=01 Departure with pull  $10 - 2x_1 - 2\lambda = 0 \longrightarrow \textcircled{}$  $\gamma(3x_1+2x_2-6)=0\rightarrow 3$  $3x_1+2x_2 \leq 6 \xrightarrow{(5)}$ The following Cases arives. ere-1: when [] = 0] form (1) & (2) we get x1=4, x2=5 which violates en D& and hence this case is discarded asi-2: when A===0 form egn (3) we get 3x1 + 2x2 = 6.

Page 53 of 64

form (1) & we have  $\chi_1 = \frac{8-3\lambda}{2}$ ,  $\chi_2 = 5-\lambda$ Thus  $3\left(\frac{8-3h}{2}\right) + 2\left(5-h\right) = 6$  $\int \frac{\lambda}{12} = \frac{32}{12}$ Hence  $X_1 = \frac{4}{12}$ ,  $X_2 = \frac{33}{13}$ . which Satisfy all the necessary Conditions. Hence the stationary foint is  $(x_1 x_2, \lambda) = (\frac{4}{13}, \frac{33}{13}, \frac{32}{13})$ is Optimal solution & value is  $Z = 8\left(\frac{4}{13}\right) + 10\left(\frac{33}{13}\right) - \left(\frac{4}{13}\right)^{\mu} - \left(\frac{33}{13}\right)^{\mu}$  $Z = \frac{277}{13} / 122 \qquad \text{malling} \quad \text{and} \quad \text{malling}$ o h mater in ou (4) Solve the NLPP  $\max -f(x) = 4x_1 + 6x_2 - x_1^{N} - x_2^{N} -$ Such that x1+x2 <2, ax1+322 612 X1, X2 Z

Thus the KKT Cordition will be necessary & sufficient -for a traximum. Define the Lagrangian function L as  $L = (4x_1 + 6x_2 - x_1^{n} - x_2^{m} - x_3^{m}) - x_1 (x_1 + x_2 - 2)$ - 2 (2x, +3x) -12) The necessary Conditions are OL = 0;  $\lambda : g := 0;$   $\lambda : \ge 0;$  g := 0;  $X \ge 0$ QL =0 => 4-2x1-21-22 A2=0-1  $\frac{\partial L}{\partial x_2} = 0 \implies 6 - 2x_2 - \lambda_1 - 3\lambda_2 = 0 \longrightarrow 2$  $\partial L = 0 \implies -2x_3 = 0$ 3(3) ×1, g1=0 ⇒ ×2 (2×1+3×2-(2)=0→3) λ1 g1 = 0 → → → ×3×30 ··· (x1+x2-2)=0 ··· (4) g1 ≤ 0 ⇒ ×1+×2 ≤ 2 → €  $g_2 \leq 0 \implies 2x_1 + 3x_2 \leq 12 \longrightarrow (8)$  $\chi_1,\chi_2 \ge 0 \longrightarrow (\widehat{\mathbb{P}})$ ose-1: when  $\lambda_{1=0}$ ,  $\lambda_{2=0}$  mitimile private priv from (1) & (2) we get X1=2, X2=3 This does not satisfy (7) & (8) and hence discarded.
