

Annamacharya Institute of Technology and Sciences:: TIRUPATI

(Autonomous)

B. Tech (AK23 regulations) for the batches admitted from 2023 onwards

Minor Degree in Quantum Technologies offered to B. Tech CSE, ECE, EEE, AI DS, AI ML, CIC, CSD, CS IT, Civil and Mechanical Engineering students

Concept of Minor Degree:

• With a view to enhance the employability skills and impart deep knowledge in emerging areas which are usually not being covered in Undergraduate Degree credit framework, AICTE has come up with the concept of 'Minor Degree' in emerging areas.

• As per the guidelines of AICTE "Minor Degree or Hons. will cumulatively require additional 18 to 20 credits in the specified area in addition to the credits essential for obtaining the Undergraduate Degree in Major Discipline (i.e. 163 credits)".

Definition of Credit:

1 Hr. Lecture (L) per week	1 Credit
1 Hr. Social (T) per week	1 Credit
1 Hr. Practical (P) per week	0.5 Credit
2 Hours Practical (P) per week	1 Credit

Minimum credits to fulfil – 18

(Guidelines of AICTE)

- A 3:0 course amounts to at least 36 hours of lectures (considering holidays, exam days etc.) per semester, assuming an average length of 14 weeks for the semester.
- A n:m lab course has n hours of lectures and m sessions (2 hours each) of lab per week.
- The proposed course structure is only to provide a guideline. Based on the available teaching resources, an institute may choose to add more modules, having covered the ones mentioned here.
- Project Based Learning (PBL) is encouraged and institutes must try to incorporate projects related to the domain of the minor degree wherever possible.)

Table of Courses for Minor Degree in Quantum Technologies

Course code	Title	Credits (Theory: Lab)
QT 01 and QT 02 are both Mandatory		
QT 01	Survey of Quantum technologies and Applications	3:0
QT 02	Foundations of Quantum Technologies	3:0
At least one of QT 03 and QT 04 is Mandatory		
QT 03	Basic Programming Lab	2:1
QT 04	Basic Laboratory Course for Quantum Technologies	2:1
At least one of QT 05, QT 06, QT 07, QT 08 is Mandatory		
QT 05	Introduction to Quantum Computation	3:0
QT 06	Introduction to Quantum Communication	3:0
QT 07	Introduction to Quantum Sensing	3:0
QT 08	Introduction to Quantum Materials	3:0
Optional / Additional Courses		
QT 09	Engineering Foundations of Quantum Technologies	3:0
QT 10	Solid State Physics for Quantum Technologies	3:0
QT 11	Quantum Optics	3:0

Prerequisites for all courses: Engineering Mathematics (Linear Algebra, Complex algebra, basics of 2nd of ODEs and initial value problems, 2nd order PDEs and boundary value problems, Probability and Statistics, Random variables). Maxwell's equations and EM theory at the level of the core physics syllabus from AICTE model curriculum.

QT 01: Survey of Quantum Technologies and Applications 3:0 (Mandatory)

This course is meant to give an overview of the field of quantum technologies and make the students familiar with the state-of-the-art in all four verticals. The emphasis is not on depth in this course, but on covering the exciting aspects of the field.

Course Content and syllabus:

- Quantum Technologies – four verticals (1 lecture)
 - Motivation for Quantum Technologies
- A qualitative overview of salient aspects of quantum physics (4-5 lectures)
 - Quantum States, Wavefunctions, Probabilistic interpretation
 - Physical observables, Hermitian operators, expectation values
 - Heisenberg uncertainty principle
 - Schrodinger equation, Time evolution
 - distinction from classical physics
 - Heuristic description of Superposition, Tunnelling and entanglement
 - No cloning theorem
 - Simulating classical systems – Feynman’s idea of a quantum simulator and the birth of the field
- Quantum Computation (10-12 lectures)
 - Basics of qubits -- what is a qubit?
 - How is it different from a classical bit? – Review of classical logic gates
 - Di Vincenzo criteria for realising qubits
 - Basics of qubit gates and quantum circuits
 - Physical implementation of qubits (very qualitative description)
 - Solid State Qubits
 - Semiconducting Qubits – quantum dots, spins
 - Superconducting Qubits – charge, flux and phase
 - Topological Qubits – proposals and advantages
 - Atoms and Ions
 - Trapped ions
 - Rydberg atoms
 - Neutral atoms
 - Photonic Qubits
 - Conventional linear optical setups
 - Integrated Photonics
 - NMR qubits
 - Conventional NMR qubits
 - NV centres
 - Overview of applications and recent achievements

- RSA and Shor's algorithm
 - Quantum Advantage
 - Long term goals and strategies being followed
 - Error correction
- Quantum Sensing (8-10 lectures)
 - Basics of quantum sensing
 - Basics of Photon (single and entangled) generation and detection
 - Gravimetry
 - Atomic clock
 - Magnetometry
 - State of the art in Quantum Sensing
- Quantum Communications (8-10 lectures)
 - Basics of digital communication
 - Quantifying classical information – Shannon entropy
 - Basic ideas of quantum communication, security, eavesdropping
 - Overview of quantum communication achievements
 - Terrestrial – fibre-based
 - Free space, Satellite-based
- **Topics on Quantum Materials are to be covered in the other portions of the course wherever required and are not listed separately here.**

Course Outcomes:

Students of this course learn:

1. The general physical principles of realising qubits for computation
2. The various hardware implementations of qubits for computation
3. The basic ideas of quantum sensing
4. The applications of quantum sensing
5. The implementations of quantum communications protocols in fibre-based and free-space

QT 02: Foundations of Quantum Technologies, 3:0 (Mandatory)

This course is meant for laying down the central theoretical aspects of quantum mechanics in a rigorous manner where students learn the techniques and develop a good intuition for quantum physics.

Course Content and syllabus:

- Quantum Mechanics (16 - 18 lectures):
 - Brief overview of classical physics (This segment is meant for the student to understand what a Hamiltonian is, which will feature later in quantum mechanics)
 - Hamiltonian function and Hamilton's equations
 - Phase-space description of a system
 - Connection and Equivalence with Newton's laws for simple systems – free particle, particle moving in a conservative potential, examples of Harmonic oscillator, hydrogen atom
 - Historical evolution of quantum mechanics
 - Planck's quantum hypothesis
 - Photo electric effect
 - Atomic spectra
 - Bohr's quantisation principle
 - De Broglie's Wave particle duality
 - Postulates of Quantum Mechanics
 - State vectors and Hilbert Space
 - Dirac Bra-Ket notation
 - Measurables and Hermitian Operators
 - Unitary Transformations
 - Schrodinger Equation and Time evolution of quantum states
 - Measurement Postulate
 - Schrodinger, Heisenberg and Interaction pictures
 - Eigen values, Expectation values and Matrix elements
 - Heisenberg's Uncertainty principle
 - Density operator formalism of quantum mechanics – pure and mixed states
 - Superposition and Entanglement in quantum mechanics
 - No cloning theorem
 - Applications of postulates – Particle in a box, Hydrogen atom, Harmonic Oscillator
 - Number states, ladder operators and Coherent states of a harmonic oscillator
 - Spin and Angular momentum – spin half particles
 - Rabi problem of a spin-half particle in a rotating magnetic field

- Bosons and Fermions
- Statistical Physics (8-10 lectures)
 - Quick review of first and second laws of thermodynamics
 - Thermal Equilibrium and Gibbs principle
 - Applying Gibbs principle to Classical and Quantum harmonic oscillators
 - Bosons and Fermions and Quantum statistics – Fermi-Dirac and Bose-Einstein distributions
- Information Science (3-4 lectures)
 - Digital communication and information
 - Quantifying information in terms of Shannon entropy
 - Basic ideas of quantum information
 - Decoherence and noise
 - Introductory ideas of Kraus operators
- Brief overview of Computational Complexity (5-6 lectures)
 - Qualitative ideas of a Turing machine
 - Types of Turing machines
 - Time and Space complexity – P vs NP, PSPACE
 - Quantum complexity classes – Q, EQP, BQP, BPP, QMA
 - Post Quantum Cryptography (PQC)

Course Outcomes:

Students of this course learn

1. The most relevant mathematical techniques
2. Basic postulates of quantum mechanics and applications
3. Basics of Statistical Physics
4. Basics of Information Science
5. Basics of computational complexity

Course References:

1. Introduction to Quantum Mechanics, Griffiths D. J., 3rd Edition, Cambridge University Press (2024)
2. Introduction to Electrodynamics, Griffiths D. J., 4th edition, Cambridge University Press (2020)

QT 03: Basic Programming Lab (2:1)
(Out of QT 03 and QT 04, at least ONE is mandatory)

This course is meant to provide students a quick hands-on experience in scientific computing and its applications to areas within Quantum Technologies.

Course Content and syllabus:

- Basics of programming
 - Data structures, classes, Object-oriented programming
 - Data storage and retrieval, Memory allocation
 - Scientific plotting, documentation of codes
- Simple algorithms and benchmarking run time
 - Sorting
 - Searching
 - Arithmetic algorithms like GCD, Prime factorisation
- Numerical Integration and differential equations
 - Linear 2nd Order ODEs with constant coefficients
 - Linear 2nd order ODEs with variable coefficients
 - Boundary value problems
 - Poisson equation
 - Laplace equation
 - Wave equation
 - Diffusion Equation
- Numerical techniques in linear algebra
 - Matrix inverse
 - Eigenvalue problem
 - Diagonalisation of matrices
 - Singular value decomposition
- Numerical techniques in Probability and Statistics
 - (Pseudo) Random number generation
 - Computing statistical moments for data samples
 - Least Squares fitting
 - Error Analysis
 - Hypothesis Testing
 - Monte Carlo sampling
- Applications to Quantum Mechanics (can be done using openly available modules in languages like Python, Julia etc.)
 - Eigen energies of coupled two level systems
 - Eigen energies of two-level system coupled to oscillator (Jaynes-Cummings Model)
 - Driven two-level system – Rabi Problem
 - Driven damped oscillator — coherent states

QT 04: Basic Laboratory Course for Quantum Technologies (2:1)
(Out of QT 03 and QT 04, at least ONE is mandatory)

Course Content and syllabus:

- Optics
 - Interferometry – wavelength measurements, intensity measurements
 - Diffraction – single slit, grating
 - Microscopy – magnification, aberration
 - Polarization optics – PBS, HWP, QWP
- RLC circuits
 - Series and parallel RLC circuits – Verifying the quality factor formulae
 - Extracting intrinsic losses
- Digital circuits
 - Adder, Multiplier
 - Encoder, Decoder
 - D flipflop, shift registers
 - How to use common Integrated Circuit chips
- Radio Frequency Technology:
 - Using Oscilloscope
 - Ring-up and ring-down time measurements of RLC circuits
 - Measurements of different pulse-shapes generated by a function generator
 - Using Vector Network Analyser
 - Transmission and reflection measurements of coaxial cable in open, short and matched termination
 - Voltage standing wave ratio measurement
 - Amplitude and Phase quadrature, In-phase and Out-of-phase quadrature plots and Quality factor measurement of RLC circuits
 - Characterising S-parameters, ABCD and Z matrices of common 2 port networks – coaxial cable, attenuator, low pass high pass bandpass filters etc.
 - Characterising 3 port networks – directional couplers, circulators, isolators
 - Using a spectrum analyser
 - Noise from a resistor at different temperatures
- Interfacing instruments with a computer
- Data acquisition
 - Signal demodulation – heterodyne vs Homodyne, Mixing of signals
 - Sampling, digitisation using ADCs – under-sampling and aliasing, oversampling and noise

- Averaging and interpolation techniques
- Quantum Simulators
 - Running quantum protocols in a quantum simulator
 - Implementing simple quantum algorithms on cloud-based quantum computers (depending on availability of time on such machines)
- Running simple algorithms on cloud-based quantum processors (optional)

Course outcomes:

Students of this course learn

1. Basic experimental techniques in optics
2. Basic experimental techniques in characterising resonators and RLC circuits
3. Basic digital circuits
4. Fundamental techniques in RF engineering
5. Interfacing instruments with computers and carry out data acquisition

QT 05: Introduction to Quantum Computation 3:0
(Out of QT 05, QT 06, QT 07 and QT 08, at least ONE is mandatory)

Course Content and syllabus:

- Qubits versus classical bits
 - Spin-half systems and photon polarizations
 - Trapped atoms and ions
 - Artificial atoms using circuits
 - Semiconducting quantum dots
 - Single and Two qubit gates – Solovay - Kitaev Theorem
- Quantum correlations
 - Entanglement and Bell's theorems
- Review of Turing machines and classical computational complexity
 - Time and space complexity (P, NP, PSPACE)
- Reversible computation
- Universal quantum logic gates and circuits
- Quantum algorithms
 - Deutsch algorithm
 - Deutsch Josza algorithm
 - Bernstein - Vazirani algorithm
 - Simon's algorithm
- Database search
 - Grover's algorithm
- Quantum Fourier Transform and prime factorization
 - Shor's Algorithm.
- Quantum complexity classes – Q, EQP, BQP, BPP, QMA
- Additional Topics in Quantum Algorithms
 - Variational Quantum Eigensolver (VQE)
 - HHL
 - QAOA
- Introduction to Error correction
 - Fault-tolerance
 - Simple error correcting codes
- Survey of current status
 - NISQ era processors
 - Quantum advantage claims
 - Roadmap for future

Course outcomes:

Students of this course learn

1. To review the basic postulates of quantum mechanics
2. The theoretical basics of qubits and their physical realisations

QT 06: Introduction to Quantum Communication
(Out of QT 05, QT 06, QT 07 and QT 08, at least ONE is mandatory)

Course Content and syllabus:

- Basics of Polarization optics
 - Quarter and half-wave plates
 - Polarizing beam splitters
- Basics of linear and square-law detectors
 - Quadrature amplitude modulation
 - Heterodyne and Homodyne demodulation and linear detectors
 - Intensity measurements and square law detectors
 - Photomultipliers, Avalanche Photo diodes
- Digital communication – information theory (basics)
 - Information entropy
 - Noiseless channel encoding
 - Noisy channel encoding
- No cloning theorem
- Quantum Memories
- Quantum repeaters
- Entanglement and Bell Theorems
- Bell Measurements and Tests
- Quantum Teleportation protocol
- Quantum Dense coding
- Quantum Key Distribution protocols

QT 07: Introduction to Quantum Sensing 3:0
(Out of QT 05, QT 06, QT 07 and QT 08, at least ONE is mandatory)

Course Content and syllabus:

- Classical sensing
 - Photo detection
- Classical noise
 - Johnson Noise, Telegraph noise, flicker or 1/f noise
- Sensitivity of classical measurements
 - Classical Fisher information
 - Cramer - Rao bounds (information theory basics may be required here).
- Quantum measurements
 - projective/orthogonal measurements
 - Approximate/non-orthogonal measurements
 - Weak continuous measurements
 - Error-disturbance relations
 - Standard quantum limits
 - Quantum non-demolition measurements
- States of light
 - Fock states
 - Coherent states
 - Squeezed states
 - Tomography
 - Wigner quasi-probability distribution
 - P-distribution
 - Husimi Q function
- Quantum photo detection
 - Square-law detectors, Intensity measurements and Photo-detection
 - Linear Detectors and Quadrature Measurements
- Quantum Cramer-Rao bounds
- Single photon-based sensing applications
- Entanglement based sensing applications
- Atomic state-based sensing, solid-state spin-based sensing applications (gravimetry, magnetometry)

Course Outcomes:

Students of this course learn

1. The basics of classical sensing
2. Aspects of quantum measurement
3. Ways to quantify quantum sensing
4. About measurements of quantum states of light
5. About the applications of quantum sensing

QT 08: Introduction to Quantum Materials 3:0
(Out of QT 05, QT 06, QT 07 and QT 08, at least ONE is mandatory)

Course Content and syllabus:

- Band theory basics
 - Metals, Semiconductors and Insulators
 - Band structure of solids
 - Survey of semiconducting devices for quantum technologies (electronic, quantum optical devices and principle of operation)
- Correlated systems
- Magnetism
 - Para, ferro magnetism basics
 - Magnetic measurements, hall effect, magnetoresistance
 - Faraday and Kerr effects
- Superconductivity
 - BCS theory
 - Ginzburg Landau
 - Josephson Effect – AC and DC Josephson effects
 - Survey of superconducting devices for quantum technologies
- 2D materials
 - Graphene and its properties – single and few layers
 - Transition Metal Dichalcogenides – Electronic and Optical Properties
- Topological Phases of matter
 - Basics of Topology
 - Geometric phases - Berry Phase
 - Aharonov Bohm effect
 - Topological phases of matter
- Survey of material growth techniques
 - Molecular beam epitaxy
 - Chemical vapor deposition, MOVPE
 - Pulsed laser deposition, etc.
 - Crystal growth techniques

Course Outcomes:

Students of this course learn

1. The basic idea of quantum materials
2. The basics of band theory of solids
3. The basics of magnetism
4. The basics of superconductivity
5. About new 2D materials like graphene, TMDCs
6. About topology and topological phases of matter

QT 09: Engineering Foundations of Quantum Technologies 3:0 (optional / additional)

This course is meant to cover topics in electrical, electronics and communication engineering, as well as in computer science that are relevant to Quantum computation, Communications and Sensing. This is a survey course and not meant for a rigorous treatment of each topic.

Course Content and syllabus:

- Electrical Networks (4 hours)
 - Analog RLC circuits – resonances, impedances, quality factors
 - Transmission line basics (2 hours)
 - Telegrapher equations, wave impedance, impedance matching, transmission line resonators
- Computer Science (15 hours)
 - Basics of computer architecture (1 hour)
 - Arithmetic Logic Unit
 - Memory
 - Abstract models of computation (12 hours)
 - Finite State Machine
 - Turing Machines
 - Overview of Hierarchy of languages – Regular, Context-Free, Turing Decidable and Turing Recognisable
 - Complexity Theory (2 hours)
 - Time and Space complexity
 - P vs NP, NP-completeness
- Electrical Communications (1 hour)
 - Analog Communications (1 hour)
 - Quadrature amplitude modulation
 - Heterodyne and Homodyne demodulation
- Noise and Signals (6 hours)
 - Characterising Noise
 - Types of Noise
 - Shot Noise
 - Johnson-Nyquist Noise
 - Telegraphic noise or flicker or 1/f noise
 - Signal conditioning and noise mitigation
 - Amplification and Added Noise
 - Linear Amplifier theory
 - Signal-Noise Ratio, Added Noise, Noise Figure of amplification
 - Dynamic Range
 - Noise temperature
 - Quantum limits on noise in linear amplifiers

QT 10: Solid State Physics for Quantum Technologies 3:0
(optional / additional)

Course Content and syllabus:

- Structure of solids –
 - Symmetry, Bravais lattices
 - Laue equations and Bragg's law,
 - Brillouin Zones
 - Atomic scattering and structure factors.
- Characterisation of crystal structures – XRD etc.
- Bonding in solids –
 - van der Waals and Repulsive interactions,
 - Lennard Jones potential,
 - Madelung constant
- The Drude theory of metals –
 - DC & AC electrical conductivity of a metal;
 - Hall effect & magnetoresistance,
 - Density of states, Fermi-Dirac distribution, Specific heat of degenerate electron gases
 - Free electron model
- Beyond the Free electron model
 - Kronig-Penney Model
 - Periodic potential – Bloch Theorem
 - Band theory
 - Tight binding model
- Phonons in Solids
 - One dimensional monoatomic and diatomic chains
 - Normal modes and Phonons
 - Phonon spectrum
 - Long wavelength acoustic phonons and elastic constants
 - Vibrational Properties- normal modes, acoustic and optical phonons.
- Magnetism
 - Dia-, Para-, and Ferromagnetism
 - Langevin's theory of paramagnetism
 - Weiss Molecular theory
- Superconductivity:
 - Phenomenological description – Zero resistance, Meissner effect
 - London Theory
 - BCS theory
 - Ginzburg-Landau Theory
 - Type-I and type-II superconductors
 - Flux quantization

Course Outcomes:

Students of this course learn

1. Basics of solid states physics
2. Various approximations for electronic states in matter
3. The theory of phonons in solids
4. The theory of magnetism
5. The theory of superconductivity

Course References:

1. Introduction to Solid State Physics, Charles Kittel, Wiley India Edition (2019)
2. Condensed Matter Physics, M P Marder, 2nd Edition, John Wiley and Sons (2010)
3. Introduction to Superconductivity, Michael Tinkham, standard edition, Medtech (2017)

QT 11: Quantum Optics 3:0 (optional / additional)

Course Content and syllabus:

- Quantization of the electromagnetic field
 - Number states, coherent states, squeezed states
 - Hanbury-Brown and Twiss experiments – Photon bunching, Photon anti bunching
 - Hong-Ou-Mandel interference
- Theory of Optical coherence
 - Young's double slit experiment and first order coherence
 - Coherence functions of arbitrary order
 - Normal ordering, symmetric ordering and anti-normal ordering of operators
 - Interferometry
- Phase-space representations of states of light
 - Wigner distribution
 - P-function and the notion of non-classicality with some examples of nonclassical states like squeezed states and their applications
 - Husimi Q function
- Light-matter interaction
 - Classical model of light-matter interaction
 - Semi-classical model of light-matter interaction-
 - Quantum light-matter interaction
 - Rabi Model
 - Jayne's-cummings model
- Open quantum systems
 - Fermi golden rule
 - Born-Markov Lindblad Master Equation

Course Outcomes:

Students of this course learn

1. To quantise the electromagnetic field
2. The various experimental techniques in photonics
3. The various representations of states of light
4. Classical, semi-classical and fully quantum models of light-matter interaction
5. Modelling decoherence through Master equation
